

# $^{3}_{\Lambda}$ H and $^{4}_{\Lambda}$ H directed flow measurements in $\sqrt{s_{NN}}$ = 3 GeV Au+Au collisions from STAR

## 张亚鹏 (Yapeng Zhang), for STAR collaboration

**Institute of Modern Physics, CAS** 

InCheon, South Korea

5-9, Nov. 2021

# Outline

## 1) Motivation

- 2) STAR Detector System for Fixed-target Runs
- 3)  $^{3}_{\Lambda}$ H and  $^{4}_{\Lambda}$ H Reconstruction
- 4) Directed flow of  ${}^{3}_{\Lambda}H$  and  ${}^{4}_{\Lambda}H$
- 5) Summary

## 1. Hyper-Nuclei and YN interaction

### Hyper-nucleus: bound state of the hyperon(s) and nucleons.

Study on hyper-nuclei (i.e. lifetime, binding energy, decay BR.) provides valuable information of hyperon-nucleon (YN) interactions.

Binding energy of  $\Lambda$  Hypernuclei:

## **YN-interaction and Neutron Star**

"Hyperon puzzle" : the difficulty to reconcile the measured masses of neutron stars (NSs) with the presence of hyperons in their interiors. Interactios of  $\Lambda N$  and  $\Lambda NN$  may be important! [Ignazio Bombaci, JPS Conf. Proc. 17, 101002 (2017)]

Other "hyperon puzzle" solutions: quark star, dark matter, .... A. D. Popolo et al, Phys. Dark Universe 28, 100484 (2020);

#### Yapeng Zhang

# Hyper-nuclei Productions in Heavy Ion Collisions (HICs)

A. Andronic et al., Phys. Lett. <u>B697</u>, 203(2011); J. Steinheimer et al., Phys. Lett. <u>B714</u>, 85(2012)

Collective motion of baryonic matter is driven by the pressure gradient. Flow of hyper-nuclei may shed light on YNinteraction in condensed nuclear matter.

#### Yapeng Zhang

# 2. Fixed Target Setup at STAR

#### RHIC Beam Energy BES-II in 2018-2021:

➢ Fixed Target Run extends collision energy down to :  $√s_{NN} = 3 - 7.7$  GeV corresponding to baryon chemical potential:  $750 \ge \mu_B \ge 420$  MeV

# Charged Hadron PID and ${}^{3}_{\Lambda}$ H and ${}^{4}_{\Lambda}$ H Reconstruction

#### **STAR TPC Particle Identification**

2018 STAR FXT 3 GeV data set;
260M minimum biased events
1) PID of p, d, t, <sup>3</sup>He, <sup>4</sup>He, π<sup>-</sup> is made based on the dE/dx vs p/q distribution;

2) Hyper-nuclei reconstruction channels:

 ${}^{3}_{\Lambda}H \rightarrow {}^{3}He + \pi^{-} 2\text{-body}$   ${}^{3}_{\Lambda}H \rightarrow p + d + \pi^{-} 3\text{-body}$   ${}^{4}_{\Lambda}H \rightarrow {}^{4}He + \pi^{-} 2\text{-body}$ 

## **KFParticle:** Reconstruction of Short-lived Particles

#### **Concept and features:**

- Based on Kalman Filter (KF)
- Tracking and detector performance contained in Covariance matrix
- Geometry independent and Vectorized
- Natural and simple interface
- Large particle reconstruction database

## 4. Collective Flow with Event Plane Method

$$\frac{d^2 N}{p_T dp_T d\varphi} = \frac{1}{2\pi} \frac{dN}{p_T dp_T} \left\{ 1 + \sum_{n=1}^{\infty} 2v_n (p_T) \cos[n(\varphi - \Psi_R)] \right\}$$
  
-  $v_1$  Directed flow;  $-v_2$  Elliptic flow ...

1) Fixed Target  $\sqrt{s_{NN}}$  = 3 GeV Au+Au collisions

 $y_{target} \approx -1.045$ 

- 2) Charged tracks measured by TPC used for centrality definition
- 1<sup>st</sup> order event plane angle measured by Event Plane Detector(EPD)
- Event-plane resolution determination:

$$R_{1} = \langle \cos(\Psi_{1} - \Psi_{r}) \rangle = \frac{\sqrt{\pi}}{2\sqrt{2}} \chi_{1} \exp(-\frac{\chi_{1}^{2}}{4}) [I_{0}(\frac{\chi_{1}^{2}}{4}) + I_{1}(\frac{\chi_{1}^{2}}{4})]$$
$$R_{2} = \langle \cos(2(\Psi_{1} - \Psi_{r})) \rangle = \frac{\sqrt{\pi}}{2\sqrt{2}} \chi_{1} \exp(-\frac{\chi_{1}^{2}}{4}) [I_{\frac{1}{2}}(\frac{\chi_{1}^{2}}{4}) + I_{\frac{3}{2}}(\frac{\chi_{1}^{2}}{4})]$$

• The event plane resolution is in the range of 40 – 75% for the midcentrality 5-40% 3 GeV Au+Au collisions

#### Yapeng Zhang

## Angular Distributions of Hyper-nuclei

Yapeng Zhang

# Directed Flow $v_1$ vs. Rapidity

 $\sqrt{s_{NN}}$  = 3 GeV Au+Au Collisions at RHIC

- First observation of hyper-nuclei collectivity v<sub>1</sub> in high-energy nuclear collisions, EP resolution and efficiency corrections applied.
- 2) Like the cases for light nuclei, hyper-nuclei  $v_1$  seems to follow the mass number scaling within uncertainties  $\rightarrow$

**Coalescence is a dominant process for mid-rapidity hyper-nuclei formation in the collisions** 

#### Yapeng Zhang

# $\Lambda$ , ${}^{3}_{\Lambda}$ H and ${}^{4}_{\Lambda}$ H v<sub>1</sub>-Slope vs. Particle Mass

- 1) Within statistical uncertainties, the slopes of  $v_1$  for hyper-nuclei  ${}^3_{\Lambda}$ H and  ${}^4_{\Lambda}$ H seem following a mass number scaling in the 5-40% 3 GeV Au+Au collisions.
- → Coalescence is a dominant process for hyper-nuclei formation in the collisions
   → Theoritical inputs for collective flow of hyper-nuclei are needed

# 5. Summary

- 1) Light hyper-nuclei  ${}^{3}_{\Lambda}$ H and  ${}^{4}_{\Lambda}$ H are reconstructed from 3 GeV Au+Au collisions at RHIC; Largest  ${}^{3}_{\Lambda}$ H and  ${}^{4}_{\Lambda}$ H data samples collected.
- 2) First measurements of  ${}^{3}_{\Lambda}$ H and  ${}^{4}_{\Lambda}$ H directed flow (v<sub>1</sub>) from 5 40% centrality. Analysis of the systematic uncertainties is underway.
- 3)  $dv_1/dy$  slopes of hyper-nuclei  ${}^3_{\Lambda}H$  and  ${}^4_{\Lambda}H$  seem to follow a mass number scaling. This result implies that *coalescence* is a dominant process for hyper-nuclei formation in such collisions.
- 4) Theoretical inputs for collective flow of hyper-nuclei in HICs are needed.

# Thank you very much for your attention!
