Global polarization of $\Xi$ hyperons in Au+Au collisions in the STAR experiment

Egor Alpatov (for the STAR collaboration)

National Research Nuclear University MEPhI

The study of global polarization in heavy-ion collisions has revealed the presence of a vortical fluid with significant angular momentum and vorticity. This phenomenon can be observed through weak decays of particles such as $\Lambda$ hyperons. Experimental data of $\Lambda$ global polarization from RHIC and LHC provided opportunity to get new insights into the collective behavior and hydrodynamic description of the system.

Global polarization of multistrange hyperons, such as $\Xi$, can provide new information for hydrodynamic description of the system and its vorticity structure. In this talk, we will report results of $\Xi$ global polarization measurement for Au+Au collisions at $\sqrt{s_{NN}} = 19.6$ and 27 GeV.
