

Third Harmonic Flow of Charged Particles in Au+Au Collisions at $\sqrt{s}_{NN} = 200$ GeV

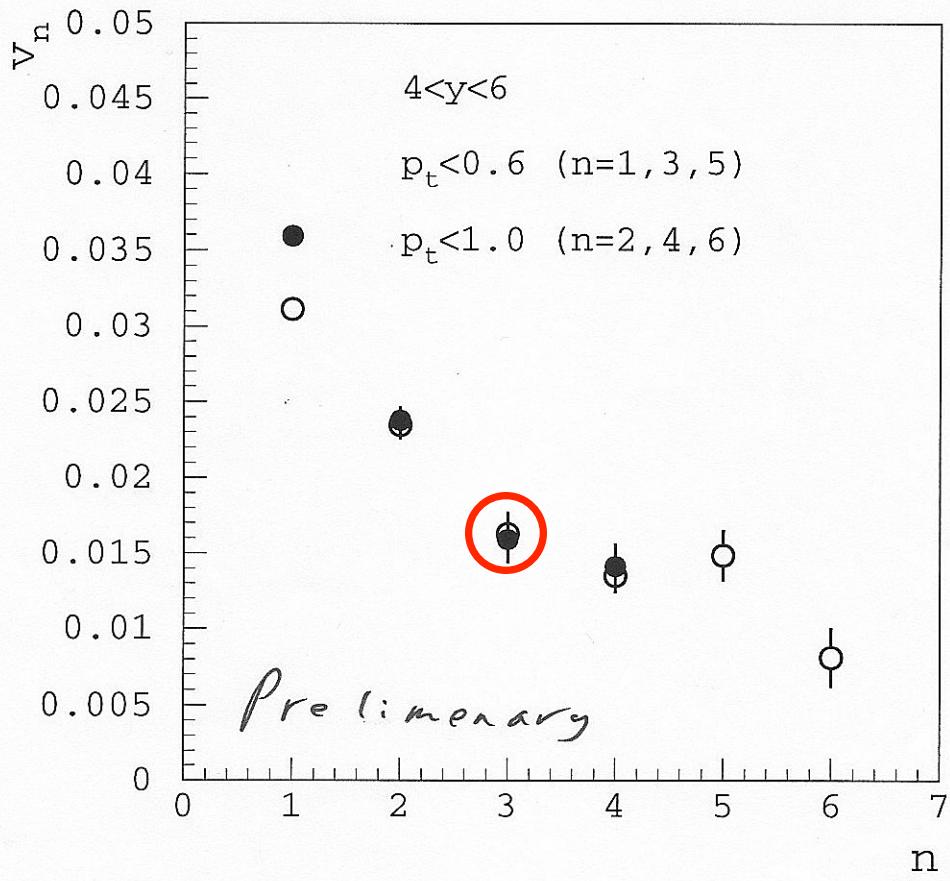

Art Poskanzer for the STAR Collaboration

Initial State Fluctuations and Final State Correlations
2-6 Jul 2012 Trento (Italy)

Trento: 14 Years Ago Higher Harmonics

98/03/24 11.18

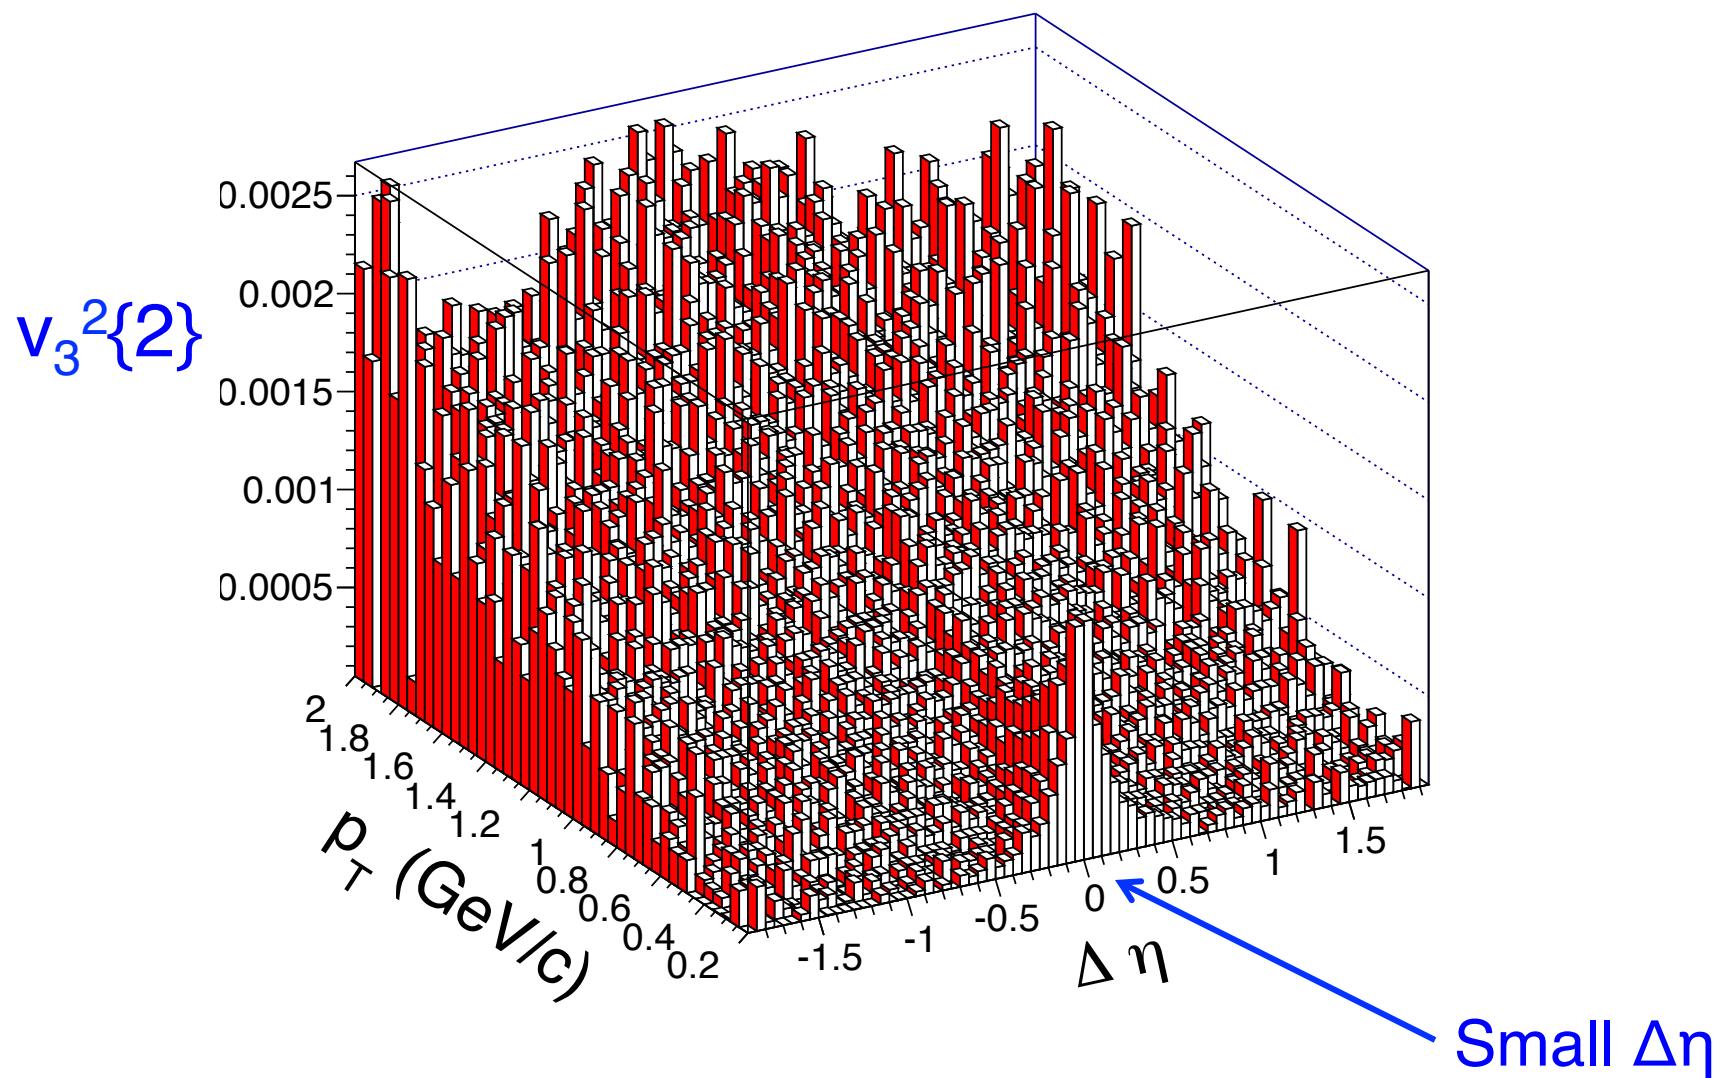

NA49

Too large, especially
for odd harmonics.
All non-flow?
Voloshin and I gave up.

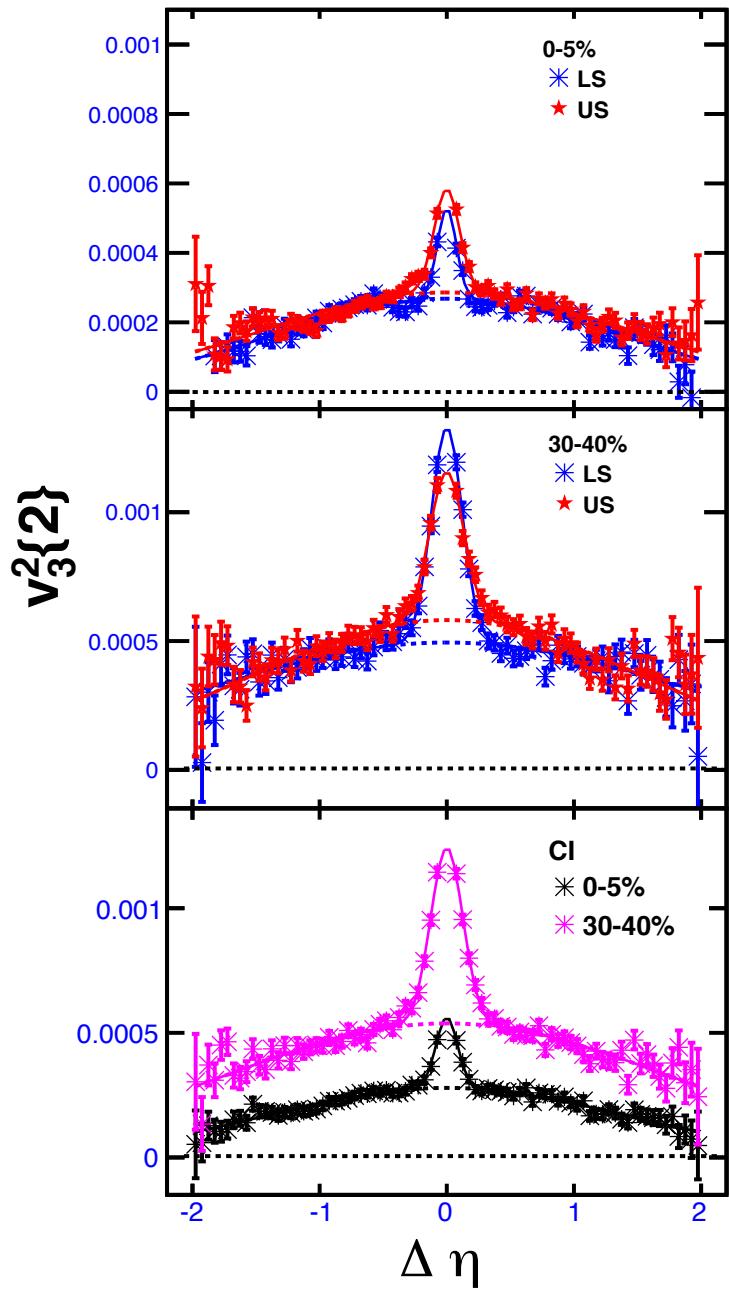

Fathers of v_3 :
Alver and Roland

Harmonic number

Short-Range Correlations

Narrow and Wide Gaussians

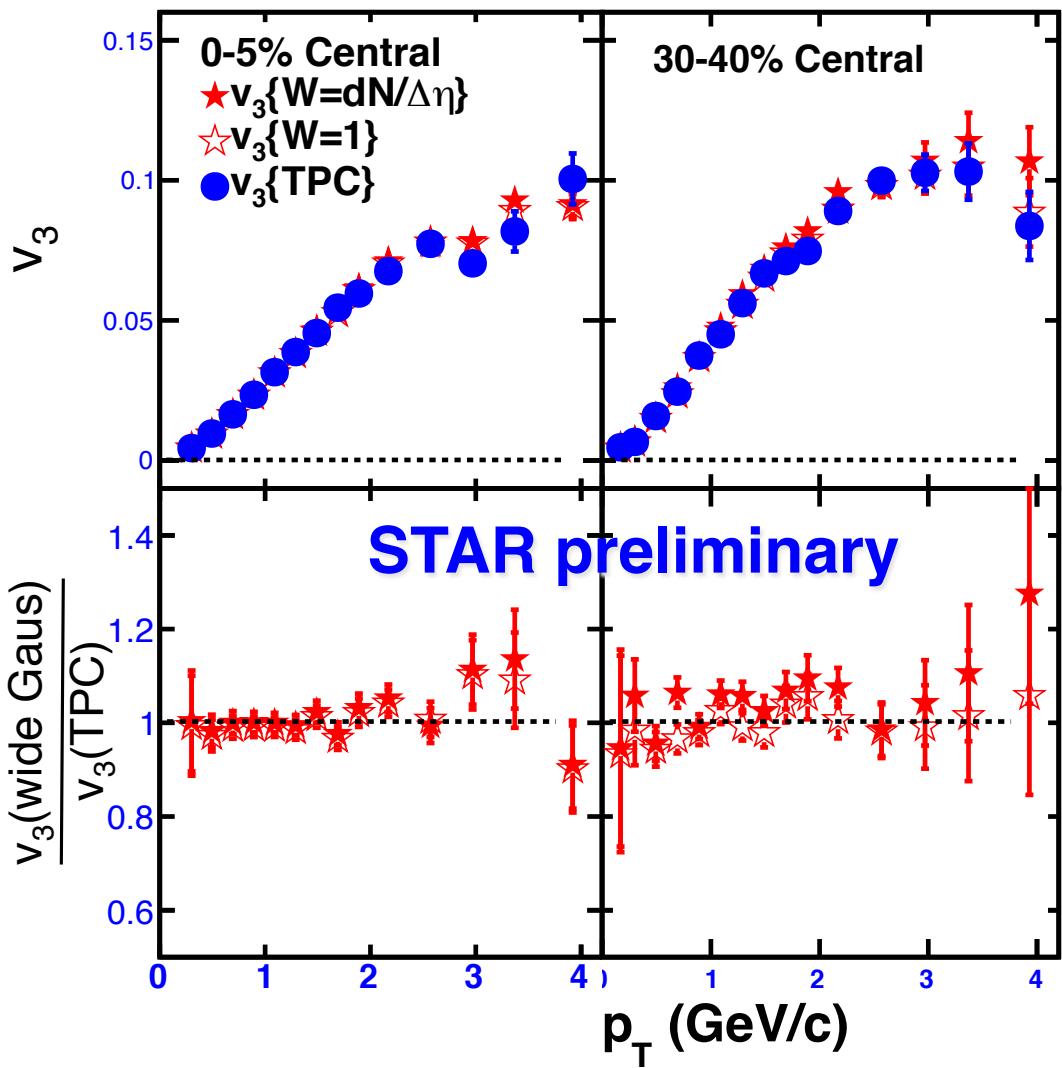

- Two Gaussian fit vs. $\Delta\eta$ for each p_T
- Dashed lines are wide Gaussians
- Get rid of narrow Gaussians

Methods

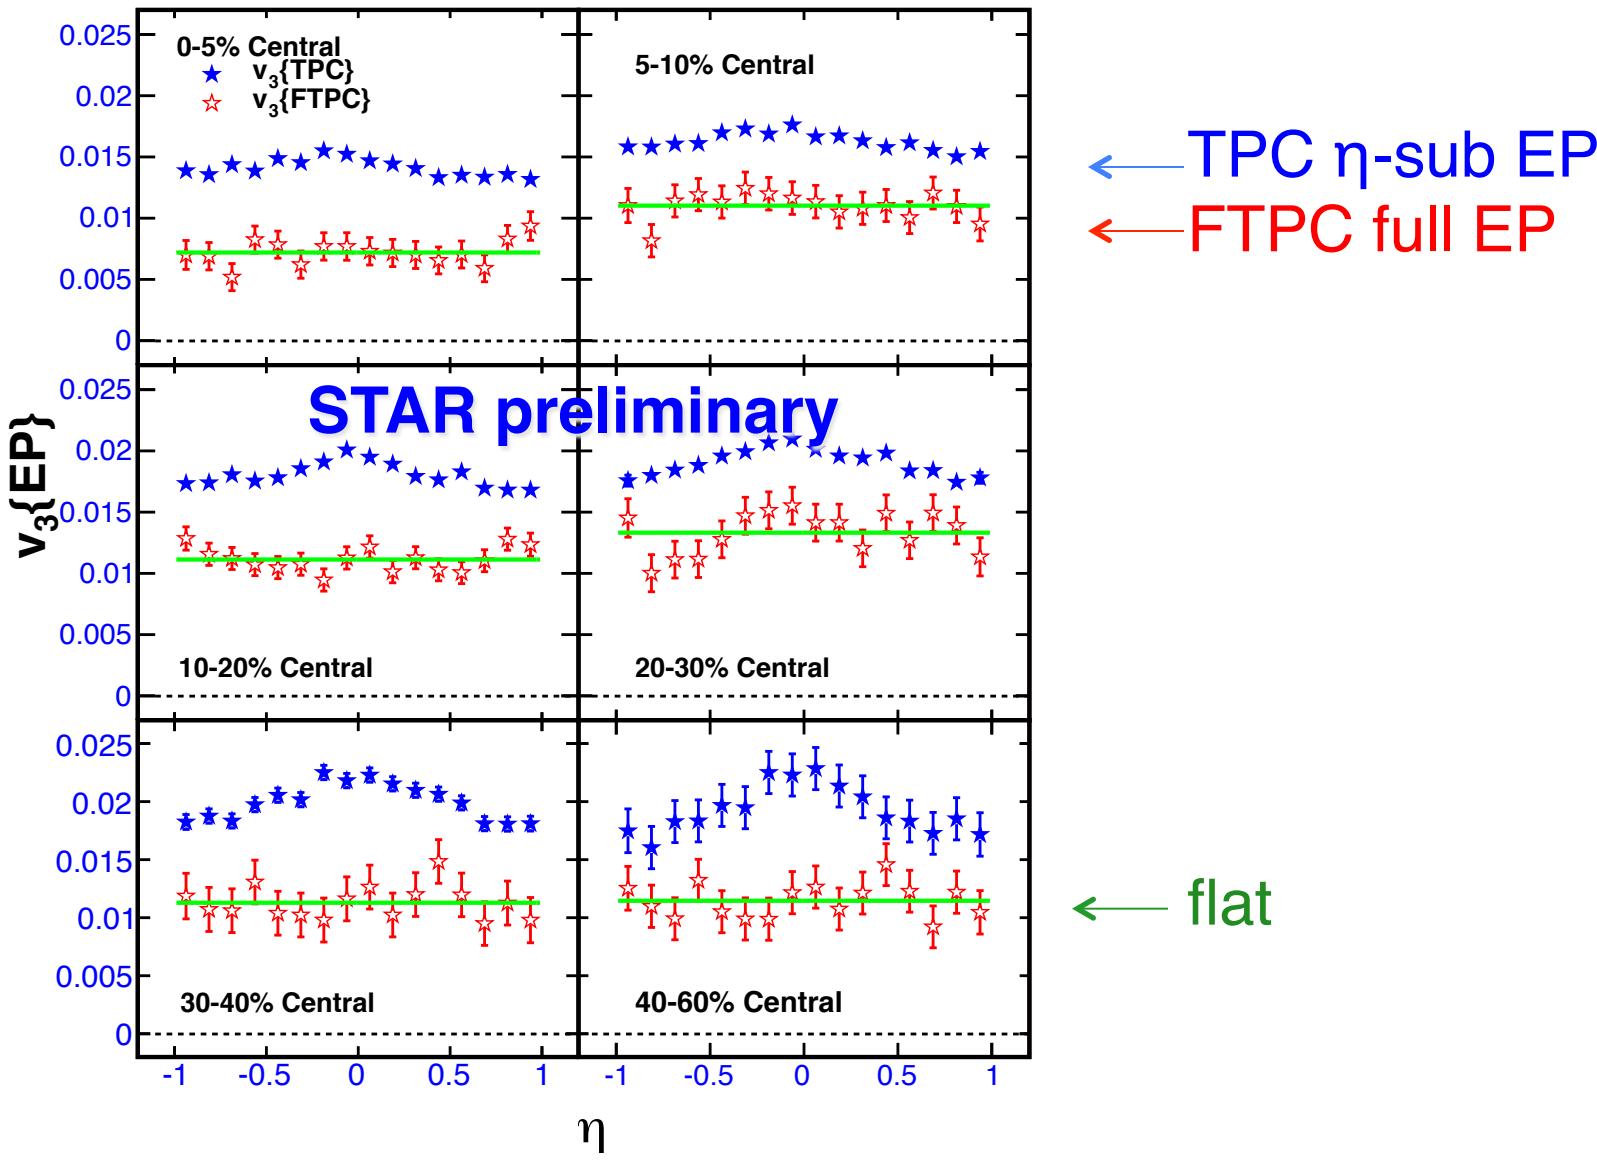

- 2-particle correlations $v_3\{2\}$
 - Wide Gaussian
 - Small η separation cut
- 4-particle correlations $v_3\{4\}$
- TPC η sub-events $v_3\{\text{TPC}\}$
 - with additional ± 0.05 separation
 - Each particle with EP of opposite sub-event
- FTPC $v_3\{\text{FTPC}\}$
 - Each TPC particle with the EP of combined FTPCs

p_T Dependence

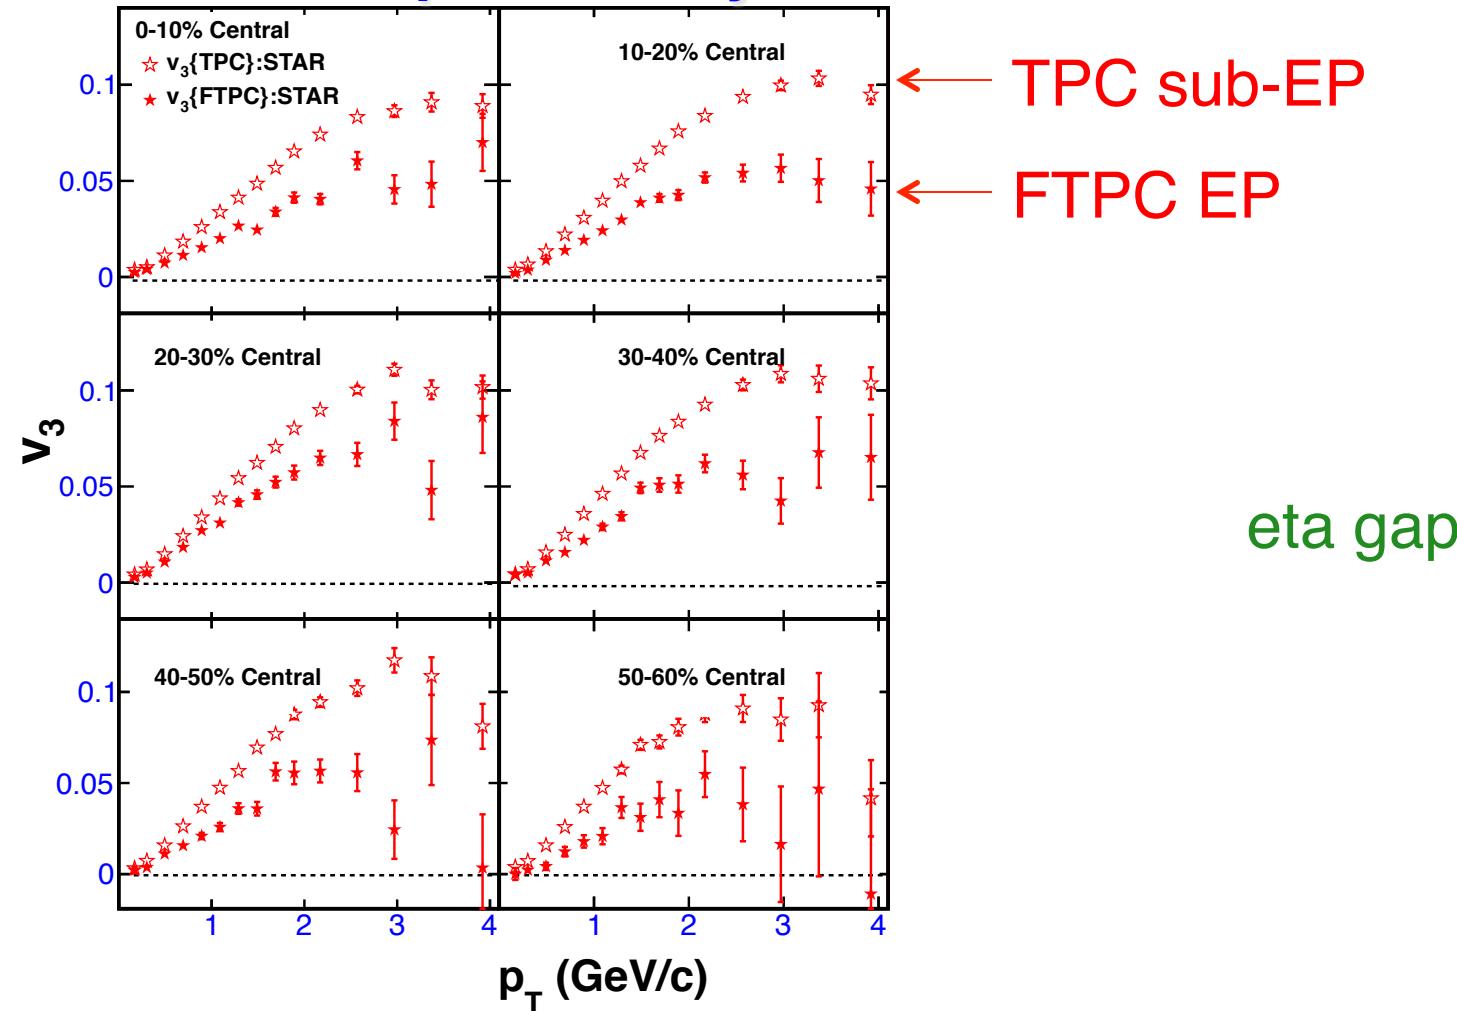

Wide Gaussian the same as TPC sub-EP.
Short-range correlations in $v_3\{\text{TPC}\}$ using opposite η -sub event plane are not significant.

Pseudorapidity Dependence

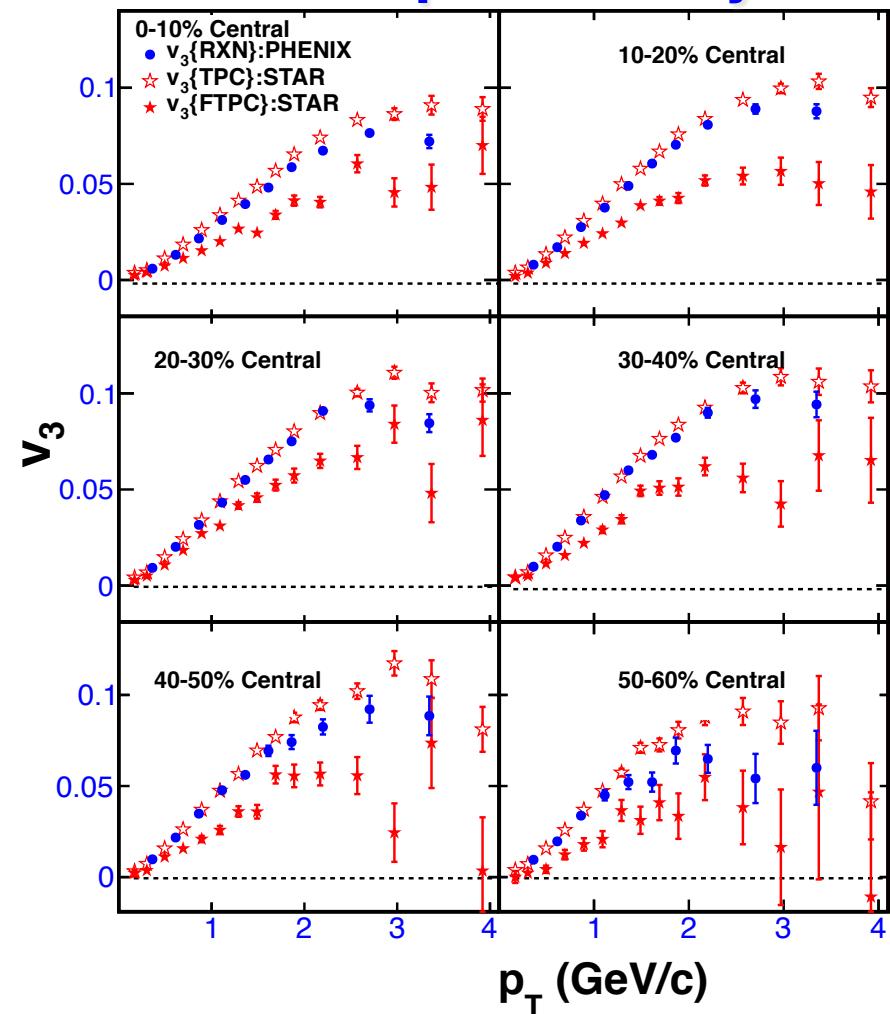

FTPC

STAR preliminary

FTPC and PHENIX

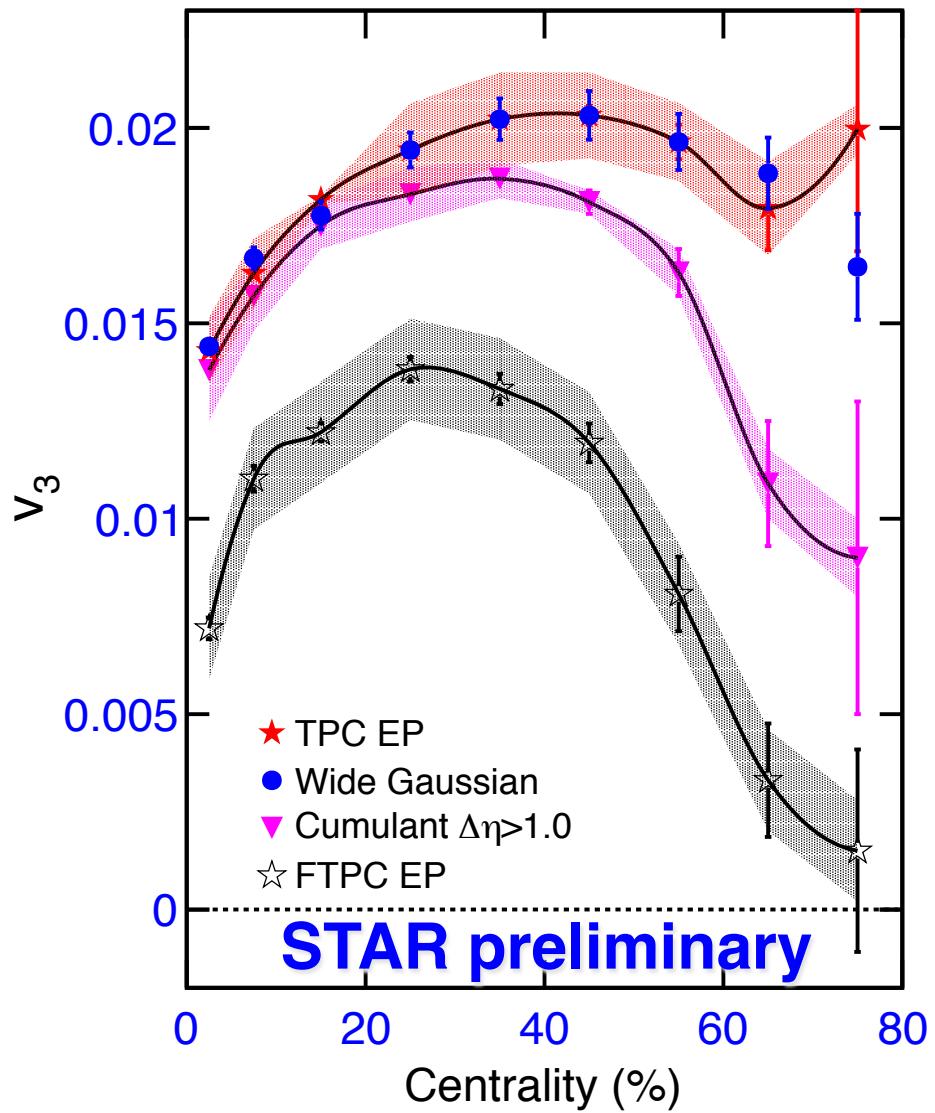

STAR preliminary

TPC sub-EP
 PHENIX RXN EP
 FTPC EP

	$\langle \Delta\eta \rangle$
TPC EP	0.63
PHENIX	≈ 1.9
FTPC EP	3.21

Centrality Dependence

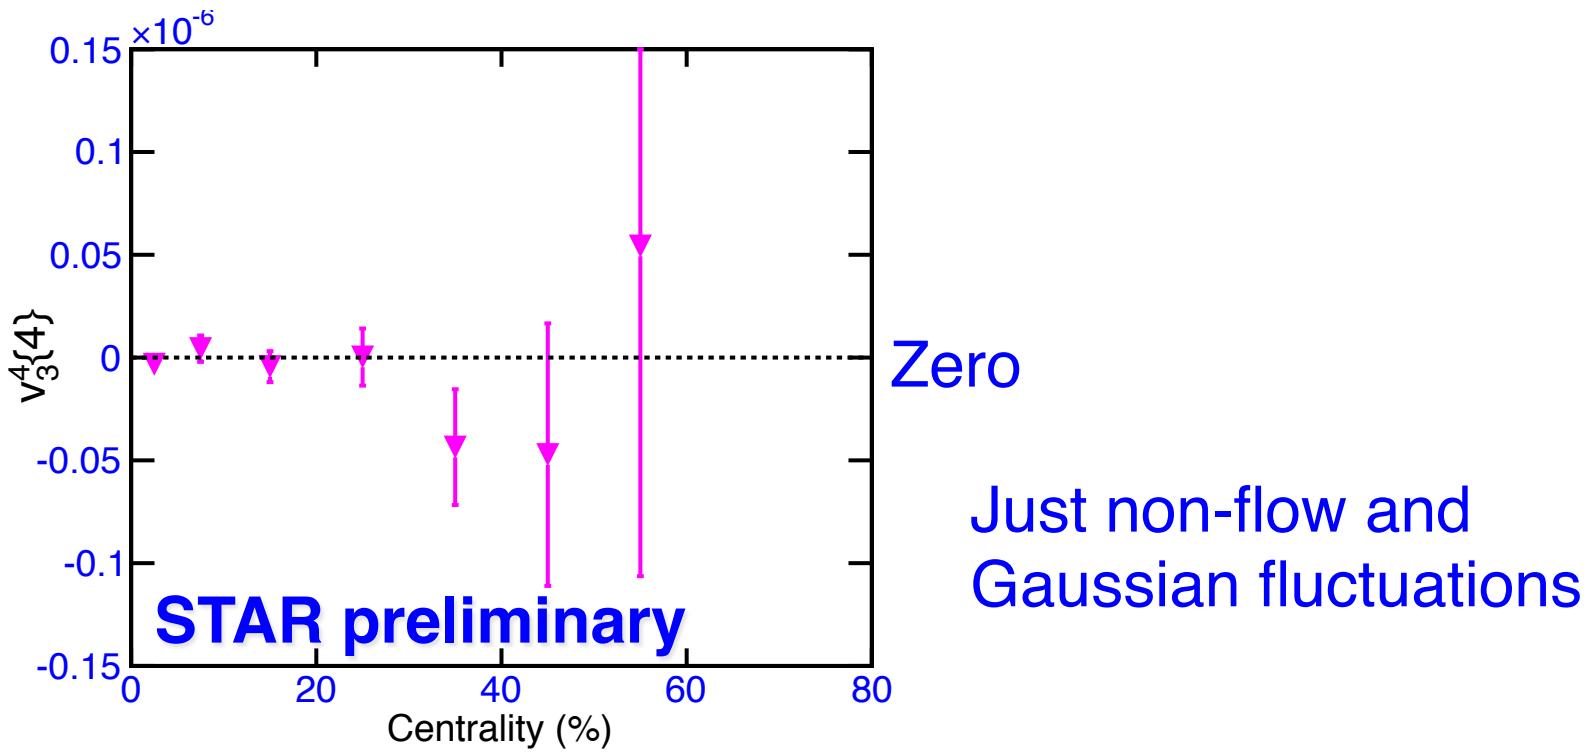

Big effect of Δn

Centrality Dependence

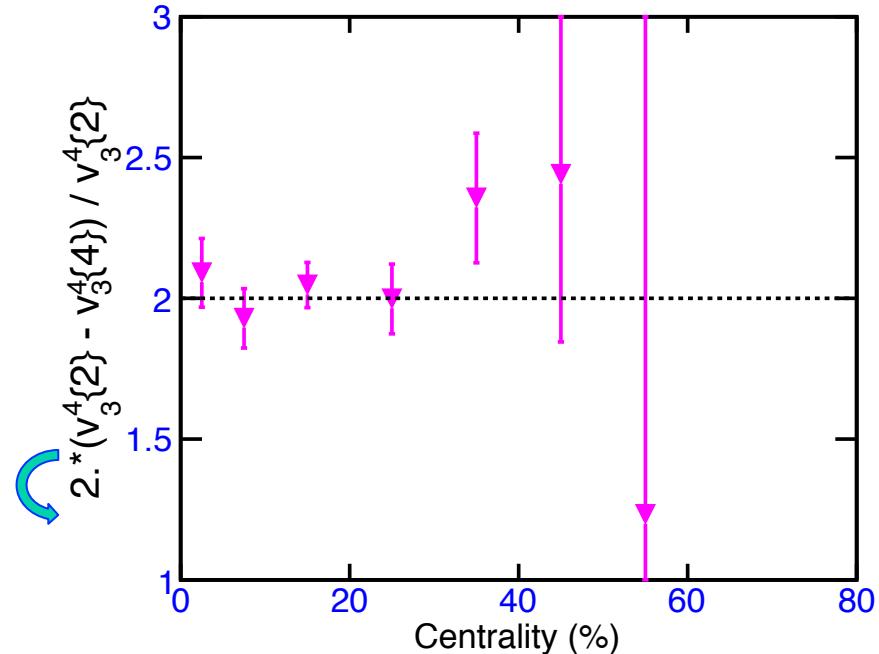

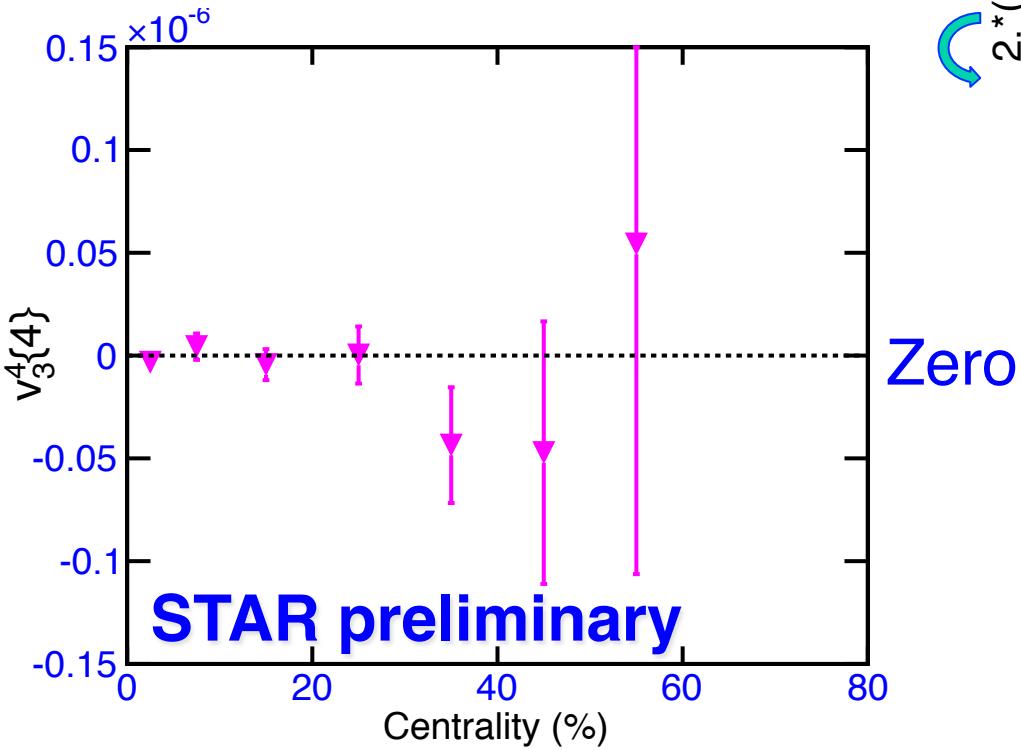

Four-particle Cumulant

$v_3^{4\{4\}}$ divided by $v_3^{4\{2\}}$

Bhalerao, Luzum, and Ollitrault:

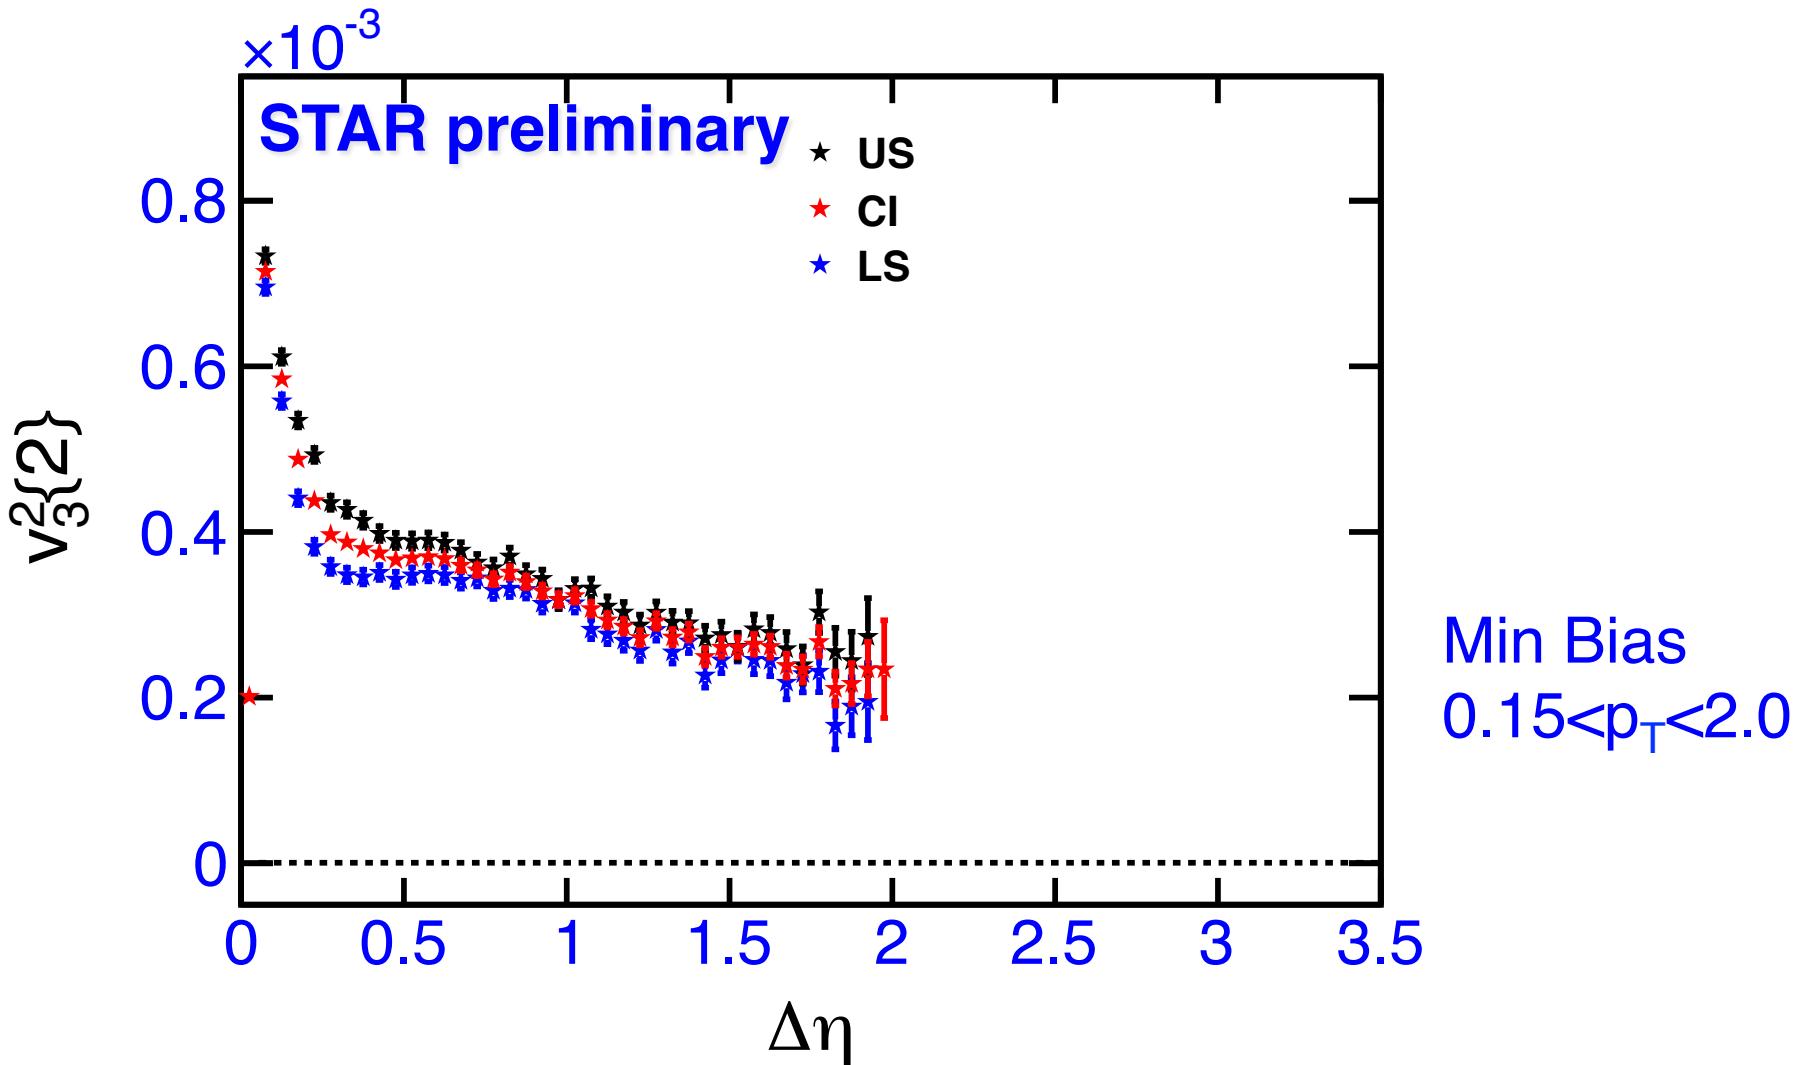

Gaussian fluctuations

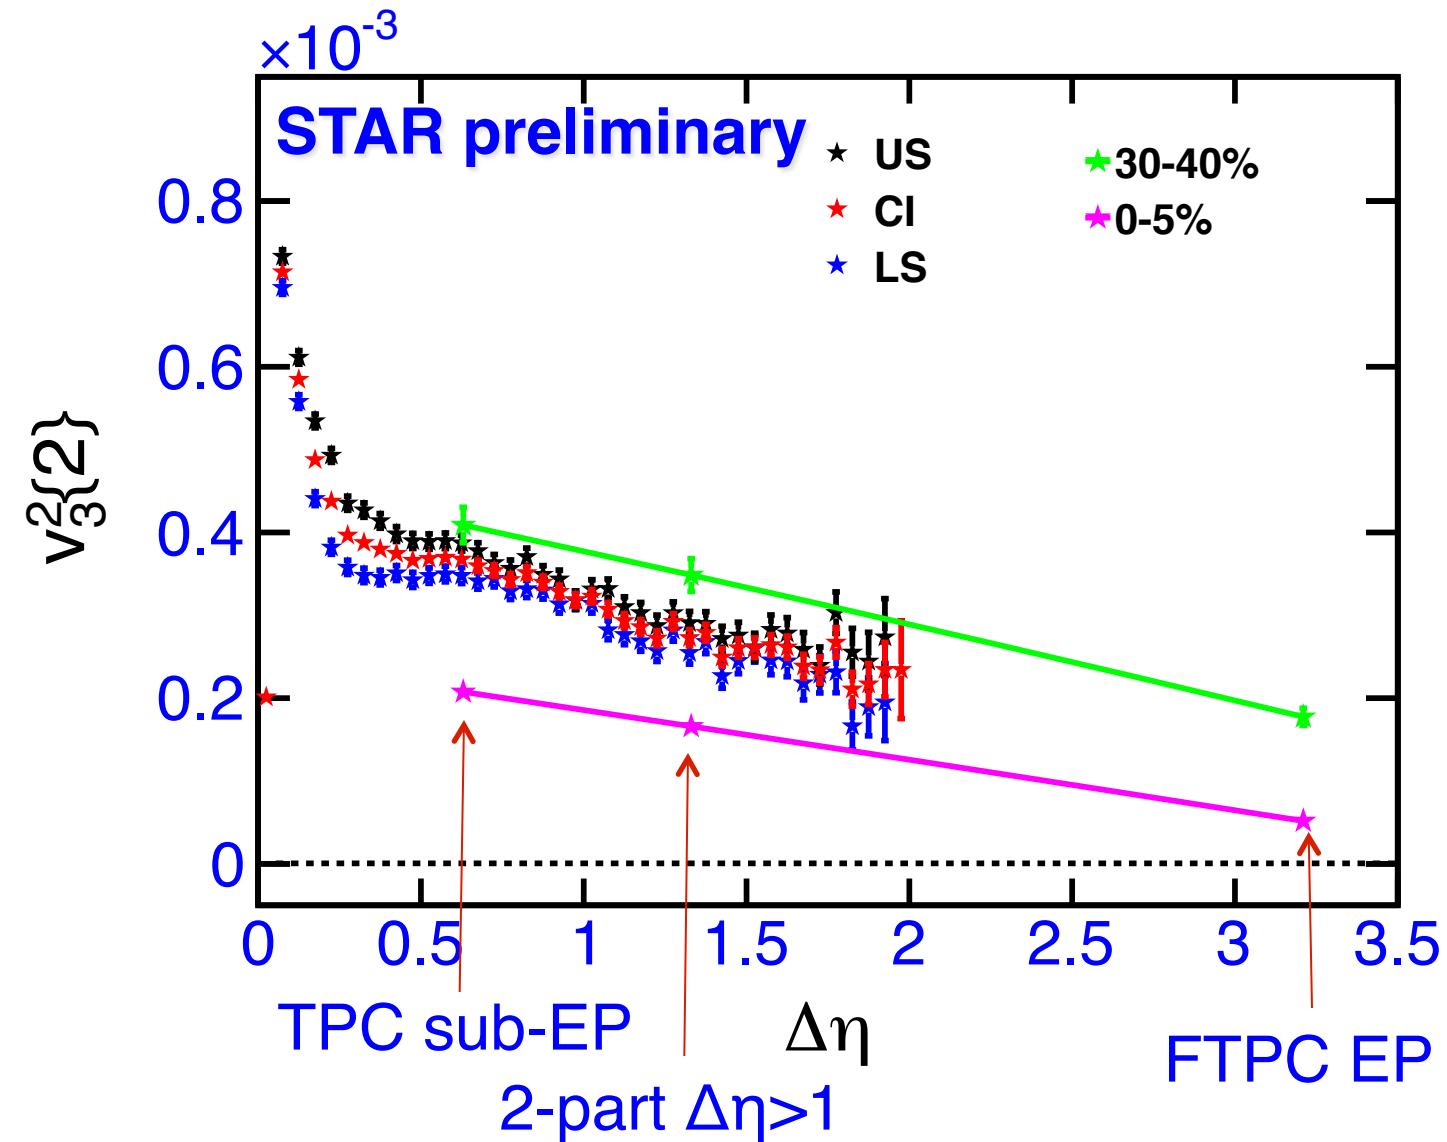

Zero

Not incompatible with ALICE

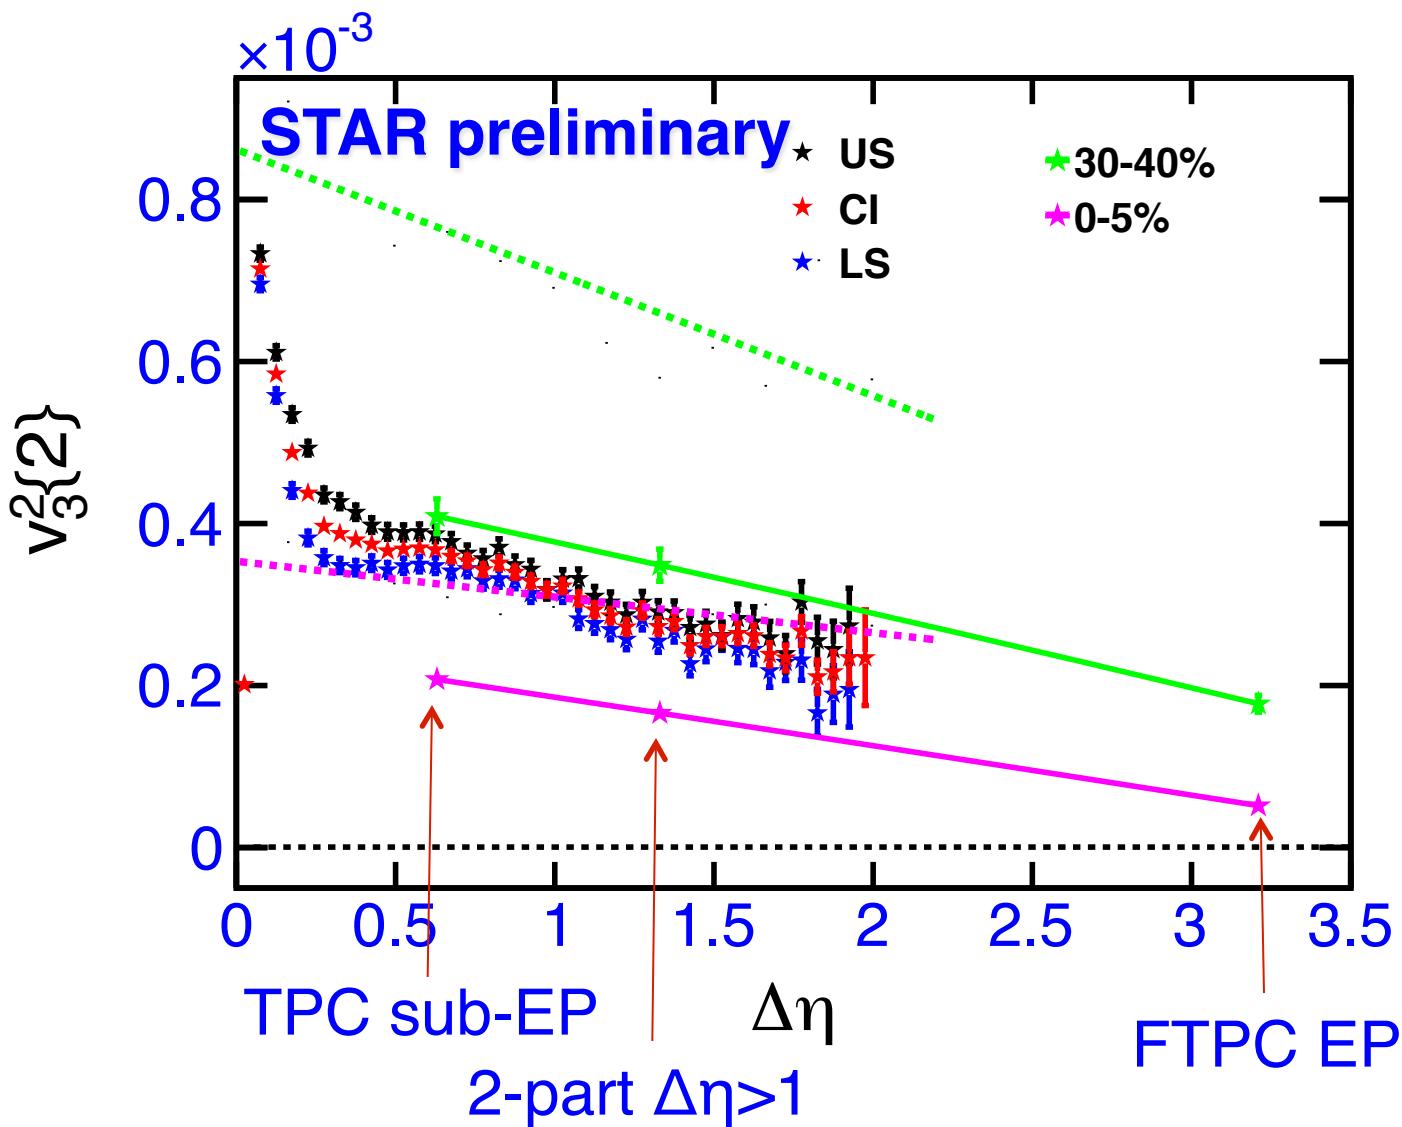

Pseudorapidity Gap Dependence

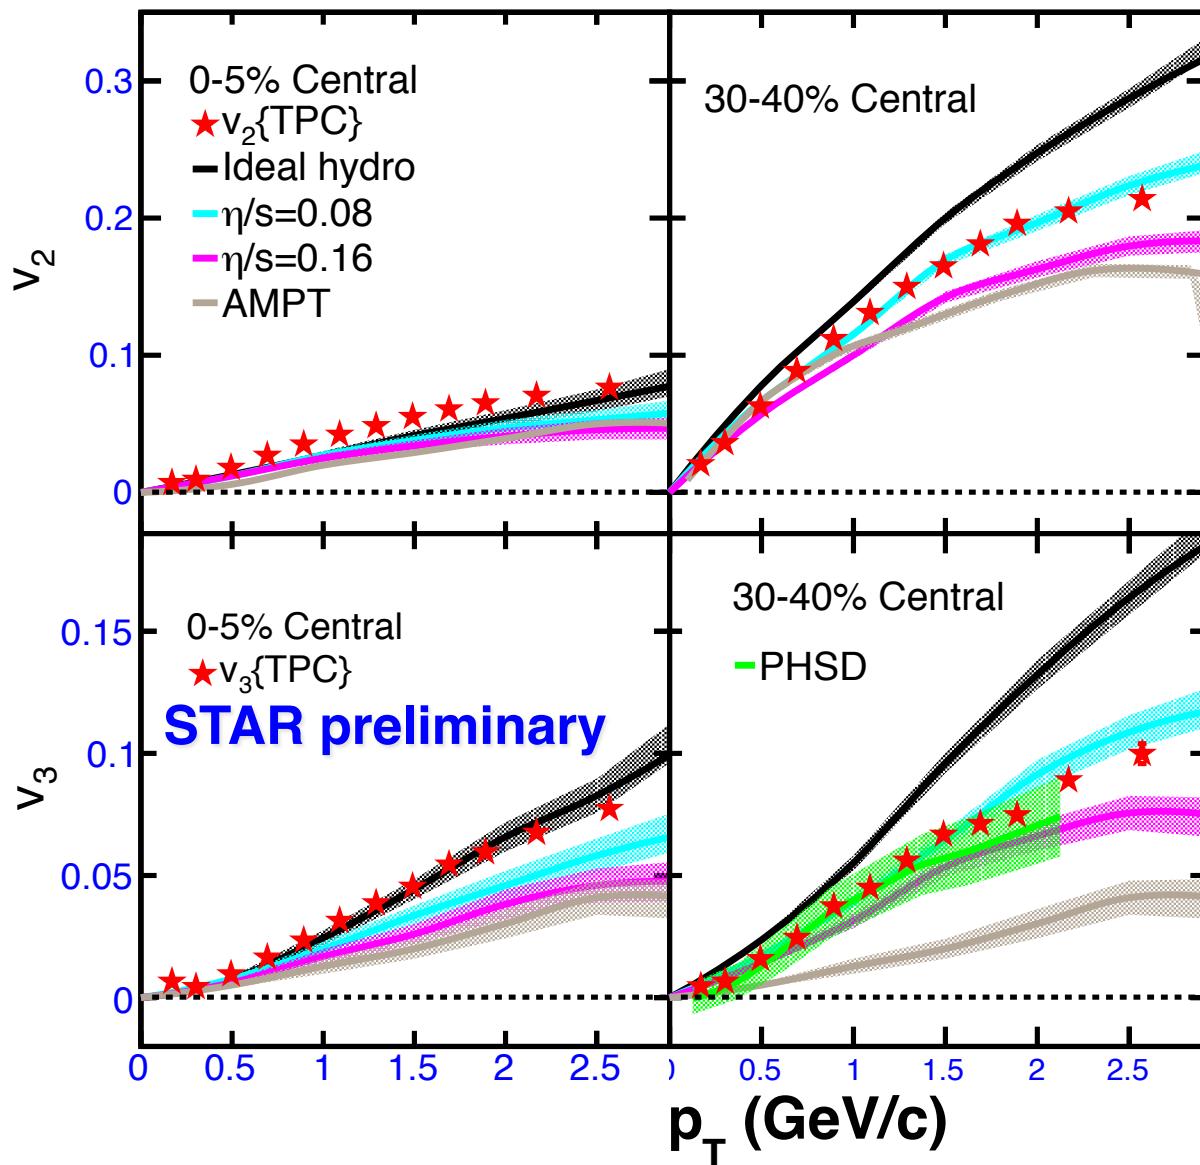

Pseudorapidity Gap Dependence

Pseudorapidity Gap Dependence

Model Comparisons

$v_2\{\text{TPC}\}$

Hydro: Schenke (old)

AMPT: Alver

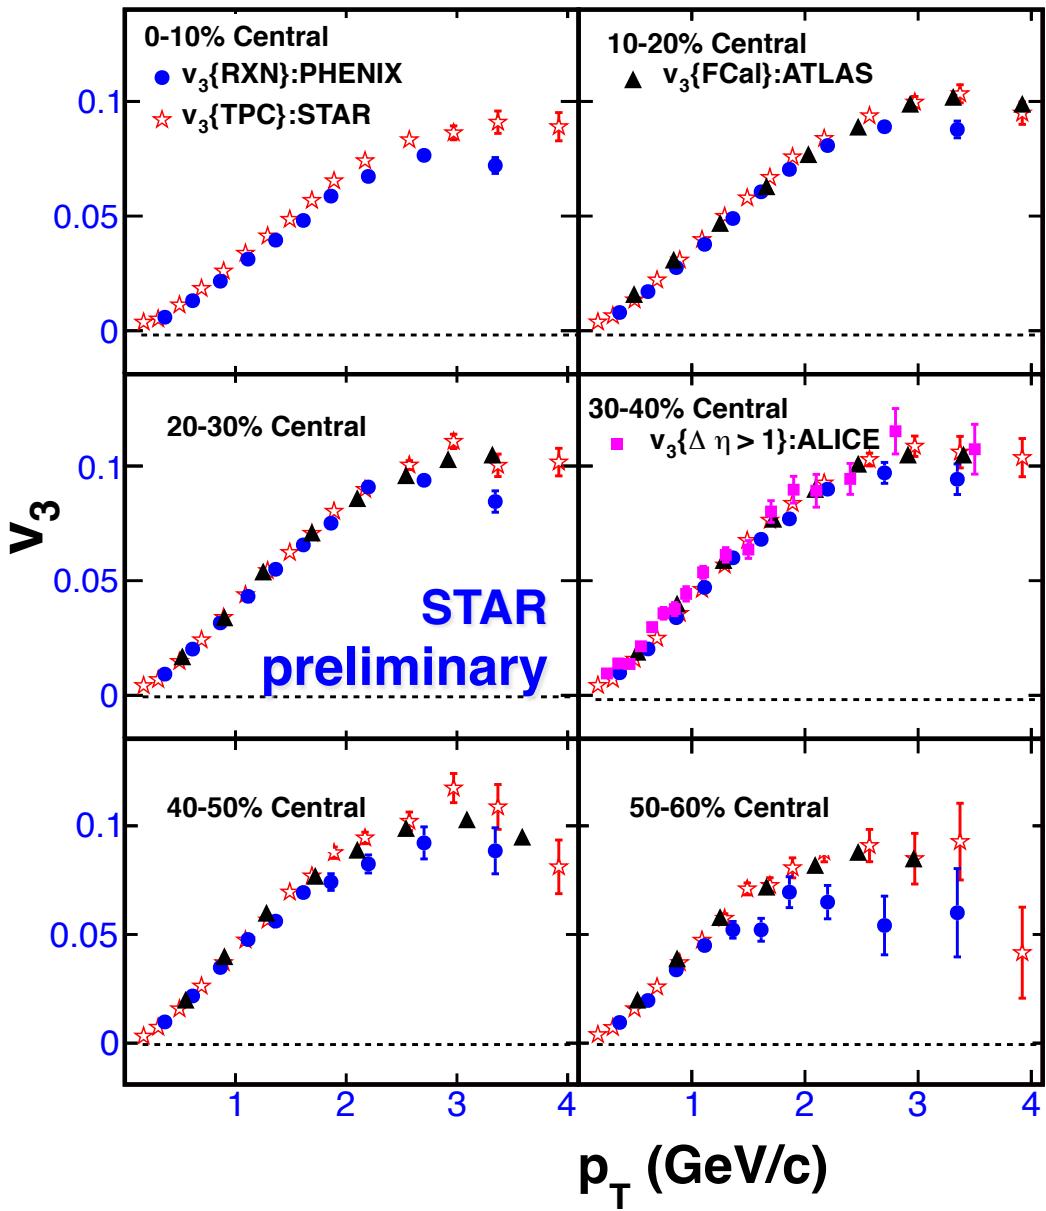

PHSD: Konchakovski

HJING very small

$v_3\{\text{TPC}\}$

No narrow Gaussian
but $\Delta\eta$ cut small

LHC Pb+Pb at $\sqrt{s}_{NN} = 2.76$ TeV

The $v_3\{\text{TPC}\}$ values agree with ALICE and ATLAS, as well as PHENIX, despite different $\Delta\eta$

	$ \eta $	$\langle \Delta\eta \rangle$
STAR	<1.0	0.63
PHENIX	<0.35	≈ 1.9
ALICE	<0.8	>1.0
ATLAS	<2.5	>0.8

Summary

- Short-range correlations with η -sub method not significant
- Strong decrease with increase of η gap
- Experiment and theory must use same $\Delta\eta$
- Calculations of non-flow at large $\Delta\eta$ small
- Most likely fluctuations
- Experimentally the same at higher beam energies (LHC)
- Should be the same at lower beam energies (BES)
