

# Overview of Gluon Helicity Measurements at STAR

Christopher Dilks  
for the STAR Collaboration  
SPIN 2018 – Ferrara, Italy  
12 September 2018

**PennState**

# Proton Spin Composition

Jaffe-Manohar Spin Sum Rule:

$$S_p = \frac{1}{2} = \Delta\Sigma/2 + \Delta G + L$$

Quark spin contribution:  $\Delta\Sigma \approx 0.2-0.3$

Gluon helicity contribution:  $\Delta G$

$\sim 0.2$  for  $x > 0.05$

**Unconstrained for lower  $x$**

Partonic Orbital Angular Momentum:  $L$  – unknown

# Polarized Gluon Distributions

$$\Delta g(x) = g_{\Rightarrow}^{\rightarrow}(x) - g_{\Rightarrow}^{\leftarrow}(x)$$

The uncertainty of  $\Delta g$  at low  $x$  remains large

# Gluon Polarization

Phys.Rev.Lett. 113 (2014) no.1, 012001

unconstrained  
for  $x < 0.05$

$$\Delta G = \int_0^1 \Delta g(x) dx$$

$\Delta G \sim 0.20 +0.06 / -0.07$   
for  $x > 0.05$

# Longitudinal Double-Spin Asymmetry

The Observable:  $A_{LL}$

$$A_{LL} = \frac{\sigma_{++} - \sigma_{+-}}{\sigma_{++} + \sigma_{+-}} = \frac{\sum \Delta f_a \otimes \Delta f_b \otimes (\hat{\sigma} \hat{a}_{LL}) \otimes D}{\sum f_a \otimes f_b \otimes \hat{\sigma} \otimes D}$$

◆ Unpolarized PDFs:  $f$  Well-understood

◆ Polarized PDFs:  $\Delta f$

- Dominant quarks well-understood
- **Gluons unconstrained at low  $x$**

◆ Hard Scattering Cross Section & Asymmetry:  $\hat{\sigma}, \hat{a}_{LL}$  Well-understood

◆ Fragmentation Functions:  $D$

- Only needed if measuring final-state hadrons
- Well-understood for quarks
- Larger uncertainties for gluons

# How to Measure $A_{LL}$

**The Observable:** 
$$A_{LL} = \frac{\sigma_{++} - \sigma_{+-}}{\sigma_{++} + \sigma_{+-}}$$

Requires 3 coincident measurements:

Yields (jets, dijets, pions, *et al.*)  
for each proton spin combination

$$A_{LL} = \frac{1}{P_1 P_2} \cdot \frac{N_{++} - \left(\frac{L_{++}}{L_{+-}}\right) N_{+-}}{N_{++} + \left(\frac{L_{++}}{L_{+-}}\right) N_{+-}}$$

Diagram illustrating the measurement of  $A_{LL}$  using coincident measurements. The equation is shown with arrows pointing to the terms:

- Two arrows point to  $P_1 P_2$  in the denominator, labeled **Beam Polarizations**.
- One arrow points to  $\left(\frac{L_{++}}{L_{+-}}\right)$  in the denominator, labeled **Relative Luminosity**.
- Two arrows point from the text above to the  $N_{++}$  and  $N_{+-}$  terms in the numerator, indicating they are yields for different proton spin combinations.

See Ting Lin's  
presentation  
(up next!) for  
further detail

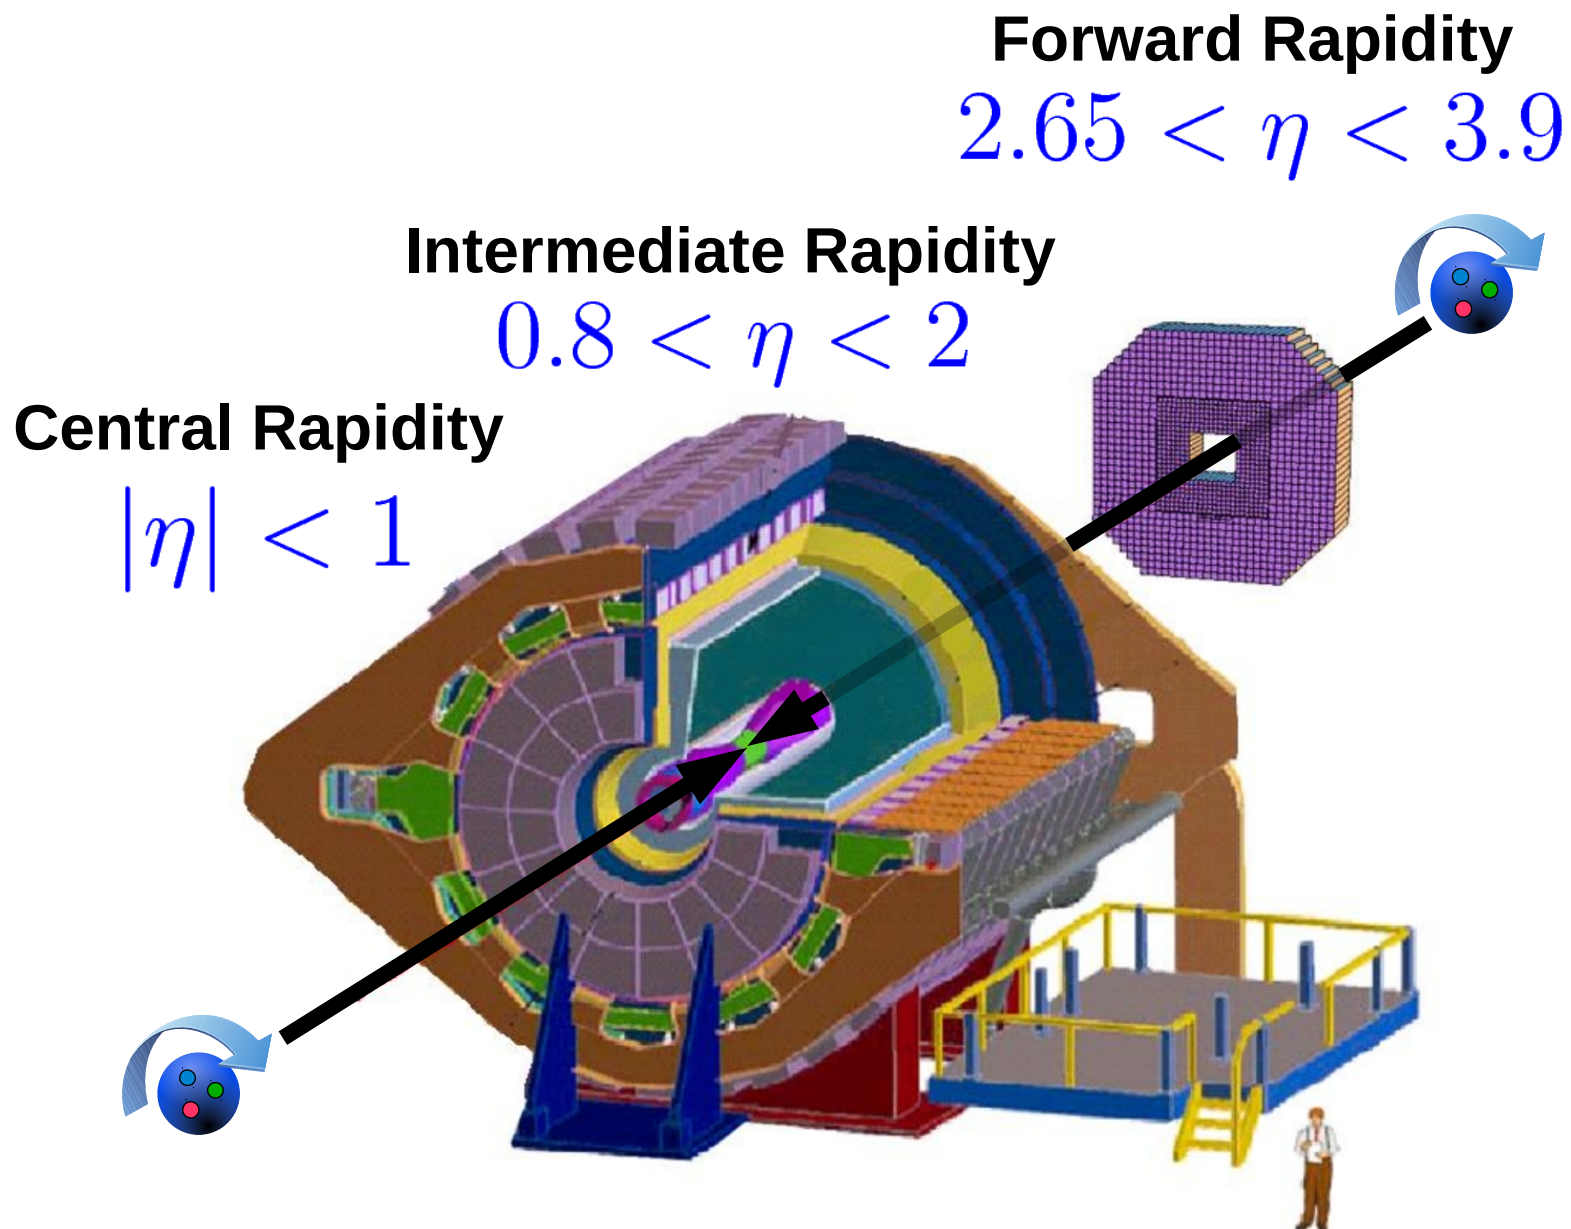

# Relativistic Heavy Ion Collider (RHIC)

**Brookhaven National  
Laboratory**  
Long Island, NY

- World's **only** polarized synchrotron collider
- Spin state known for **every** proton bunch
- Longitudinally polarized collisions achieved with **Spin Rotators**

# STAR Experiment

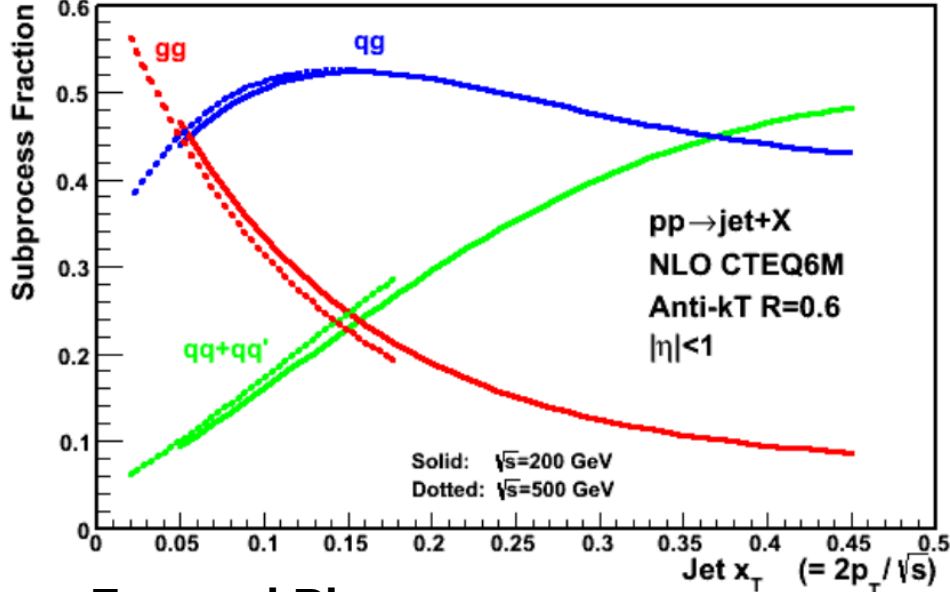

# Subprocess Sensitivity

## Central Jets

RHIC Spin Program – arXiv:1501.01220

## Forward Pions

Research Plan for Spin Physics at RHIC – 2005

- ◆ STAR observables are dominantly sensitive to **qq** scattering, as well as **gg** at low  $p_T$
- ◆ Refer to processes “C” and “A” in the parton-level asymmetry  $\hat{a}_{LL}$  figure above

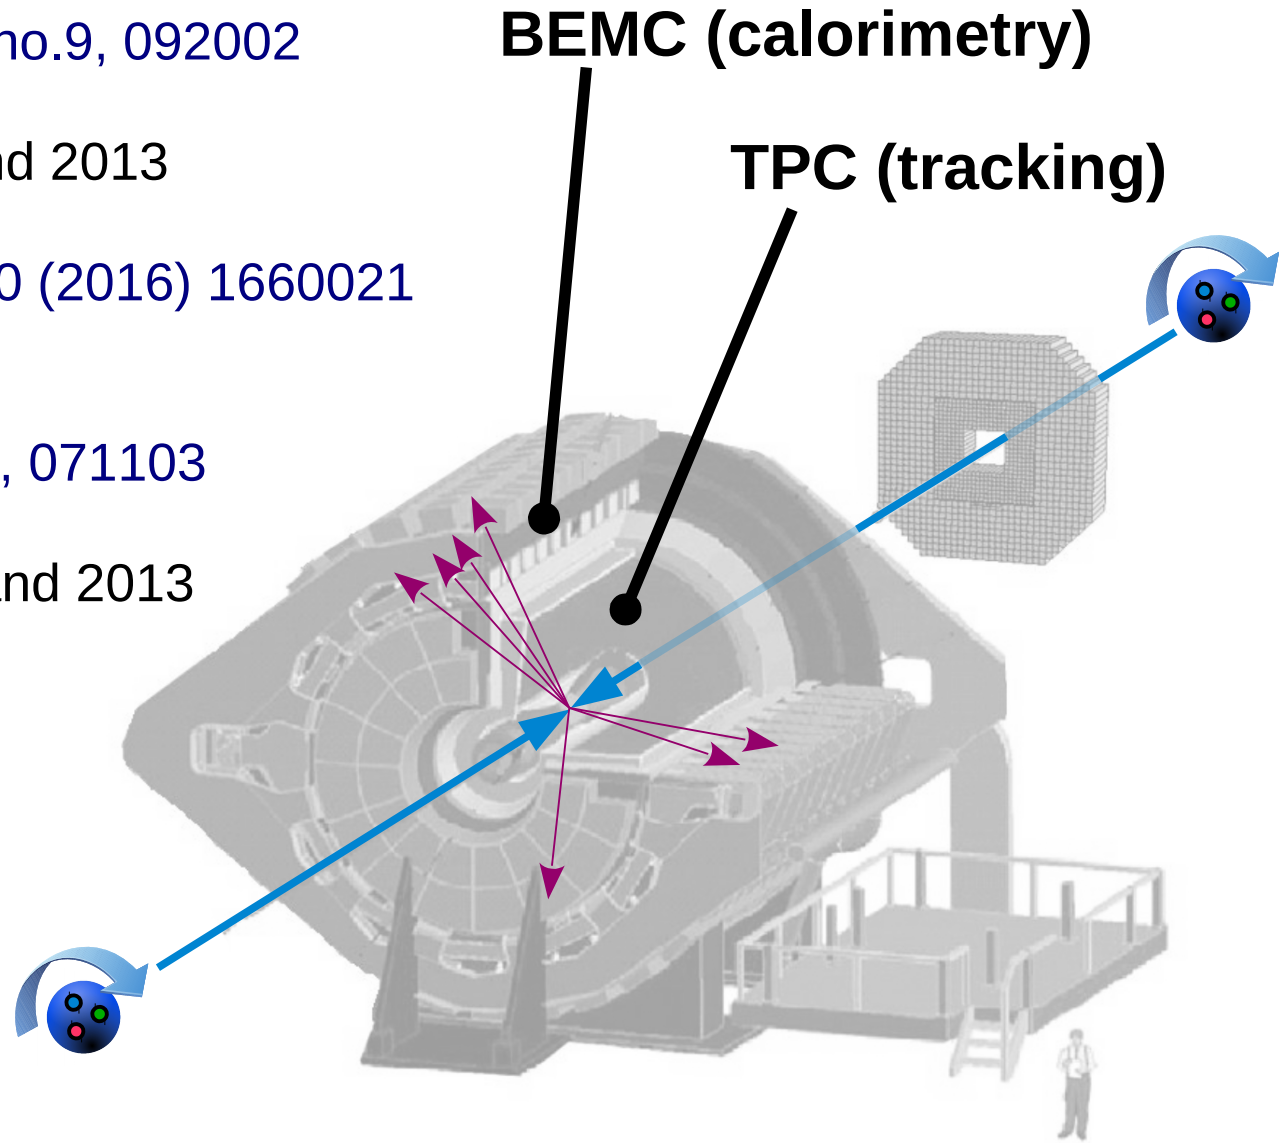

$A_{LL} \rightarrow \Delta g(x)$

# Central Rapidity

$$|\eta| < 1$$

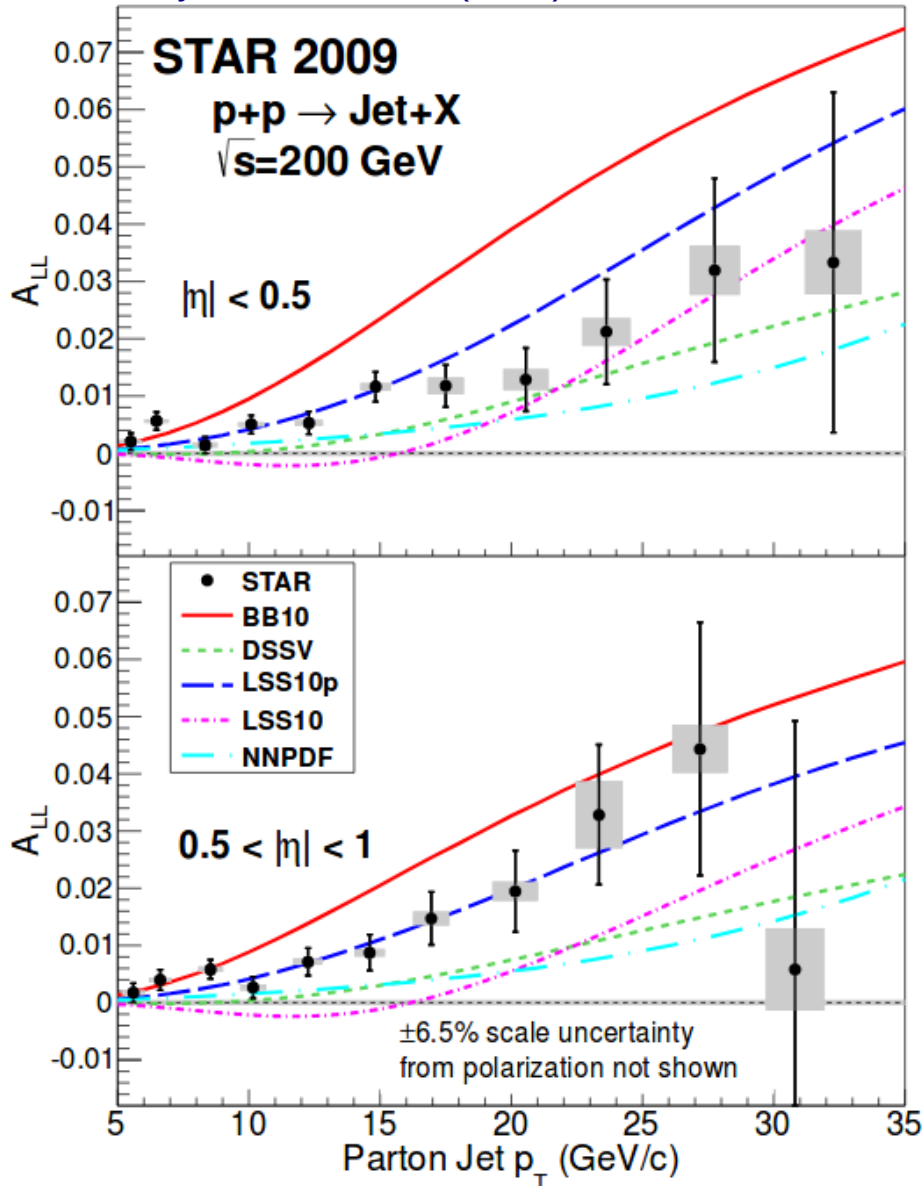

- ◆ Jets at 200 GeV in 2009  
Phys.Rev.Lett. 115 (2015) no.9, 092002
- ◆ Jets at 510 GeV in 2012 and 2013  
(STAR Preliminary)  
Int.J.Mod.Phys.Conf.Ser. 40 (2016) 1660021
- ◆ Dijets at 200 GeV in 2009  
Phys.Rev. D95 (2017) no.7, 071103
- ◆ Dijets at 510 GeV in 2012 and 2013  
(STAR Preliminary)

# Central Jets at 200 GeV in 2009

Phys.Rev.Lett. 115 (2015) no.9, 092002

- ◆ Jets reconstructed from anti- $k_T$  algorithm with  $R=0.6$
- ◆ Jet  $p_T$  corrected to parton-level, which excludes underlying event / beam remnants
- ◆ Positive  $A_{LL}$  above DSSV08 fit is evidence of positive  $\Delta g(x)$  at high  $x$

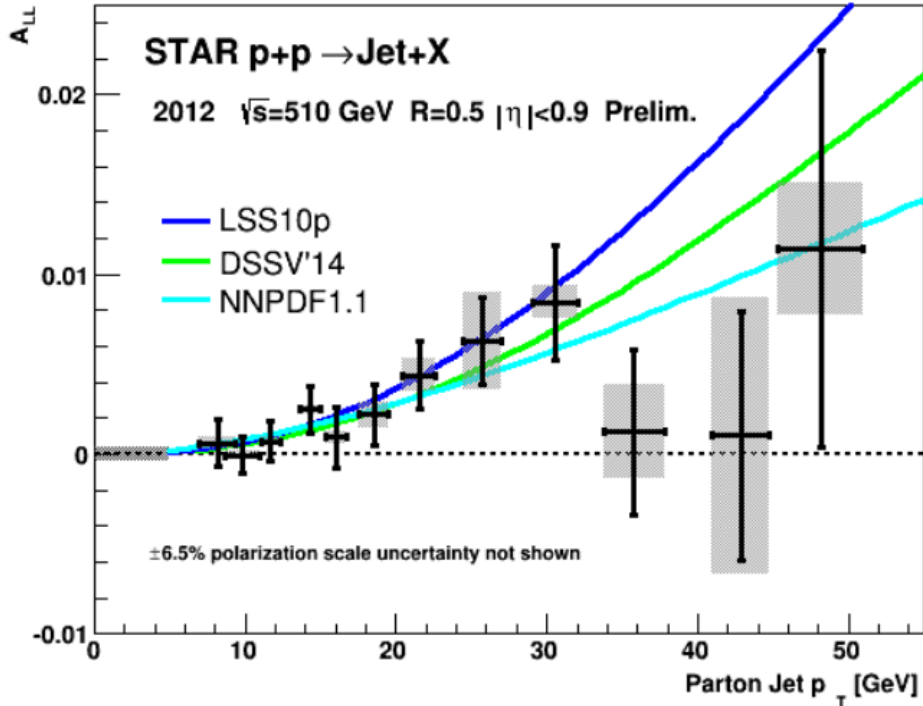

**$x > 0.05$**

# Central Jets at 510 GeV in 2012 & 2013

## 2012 Data

Int.J.Mod.Phys.Conf.Ser. 40 (2016) 1660021 (preliminary)

## 2013 Data (compared to 2012)

STAR preliminary measurement

◆ 510 GeV measurement agrees with 200 GeV measurement from 2009

◆ Reconstruction using anti- $k_T$  algorithm with  $R=0.5$

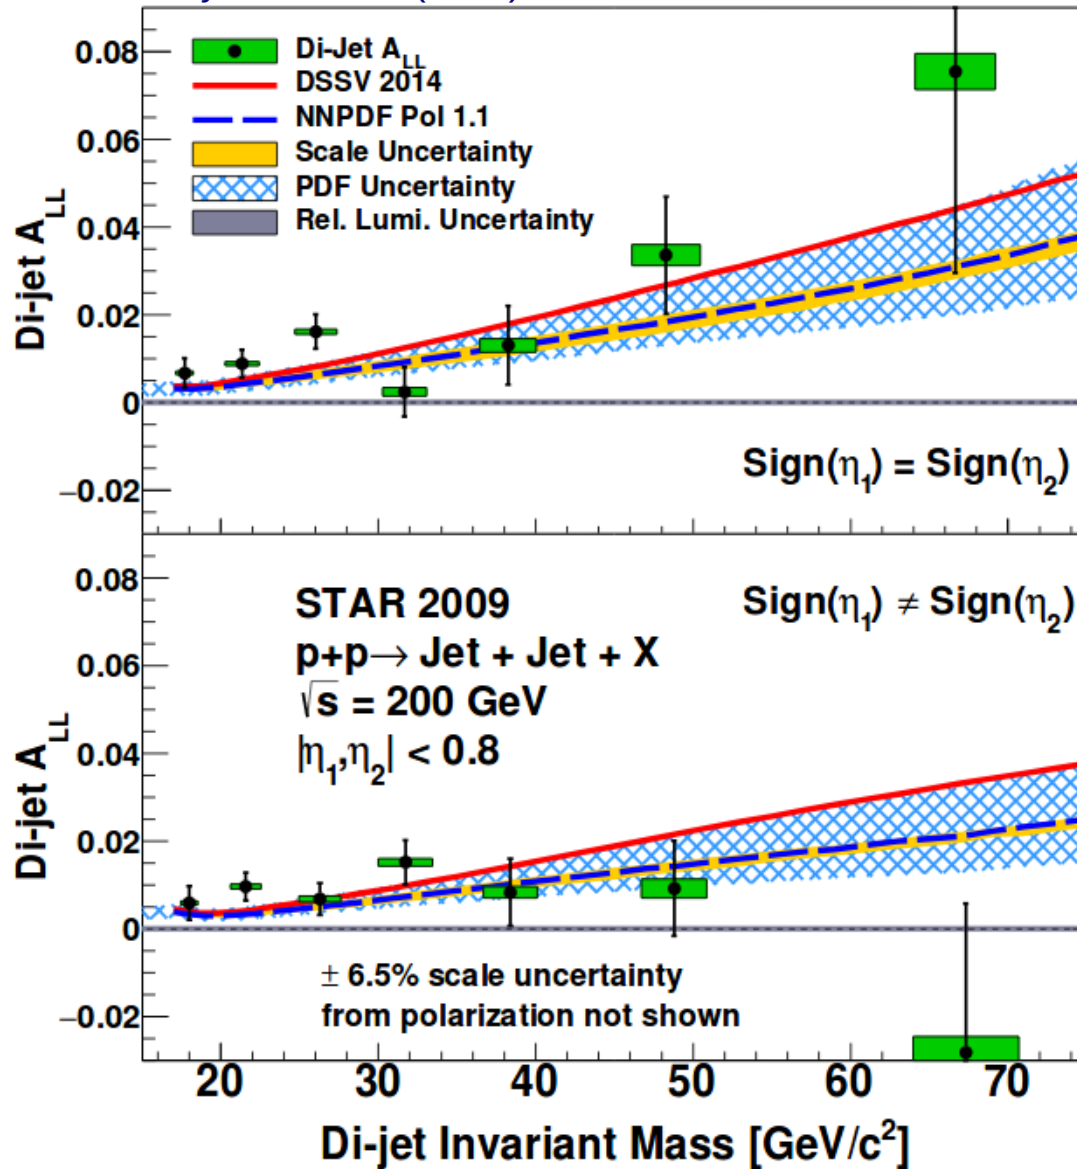

◆ Higher  $\sqrt{s}$  pushes sensitivity to lower  $x$ :  $x_{510} = \frac{200}{510} \cdot x_{200}$

**$x > 0.02$**

# Central Dijets at 200 GeV in 2009

Phys.Rev. D95 (2017) no.7, 071103

- ◆ Dijets probe a narrower x region
- ◆ Anti- $k_T$  with  $R=0.6$
- ◆ Plotted vs. dijet invariant mass

$$M = \sqrt{s x_1 x_2}$$

- ◆ Two topologies shown
  - same side jets
  - opposite side jets
- ◆ Asymmetries agree with models that predict  $\Delta G \sim 0.2$  for  $x > 0.05$

**$x > 0.05$**

# Central Dijets at 510 GeV in 2012 & 2013

- ◆ Higher  $\sqrt{s}$  pushes to lower  $x$
- ◆ Anti- $k_T$  with  $R=0.5$
- ◆ Plotted vs. parton invariant mass
- ◆ Full central region shown
- ◆ Asymmetries also agree with models

**$x > 0.02$**

- ◆ Dijets at 200 GeV in 2009  
Phys.Rev. D98 (2018) no.3, 032011  
**\* new result!**
- ◆ Pions at 200 GeV in 2006  
Phys.Rev. D89 (2014) no.1, 012001
- ◆ Pions at 510 GeV in 2012 and 2013  
Analysis Underway

# Intermediate Dijets at 200 GeV in 2009

Phys.Rev. D98 (2018) no.3, 032011

- ◆ More-forward production probes lower  $x$ , down to 0.01
- ◆ Provides tighter constraints to size and especially shape of  $\Delta g(x)$  for  $x > 0.05$
- ◆ Three topologies shown:
  - one jet forward, other jet central (opposite side)
  - one jet forward, other jet central (same side)
  - both jets forward
- ◆ forward-forward case probes lowest  $x$
- ◆ Anti- $k_T$  with  $R=0.6$
- ◆ See Ting Lin's (up next) presentation for further detail
- ◆ Analysis of 510 GeV data underway

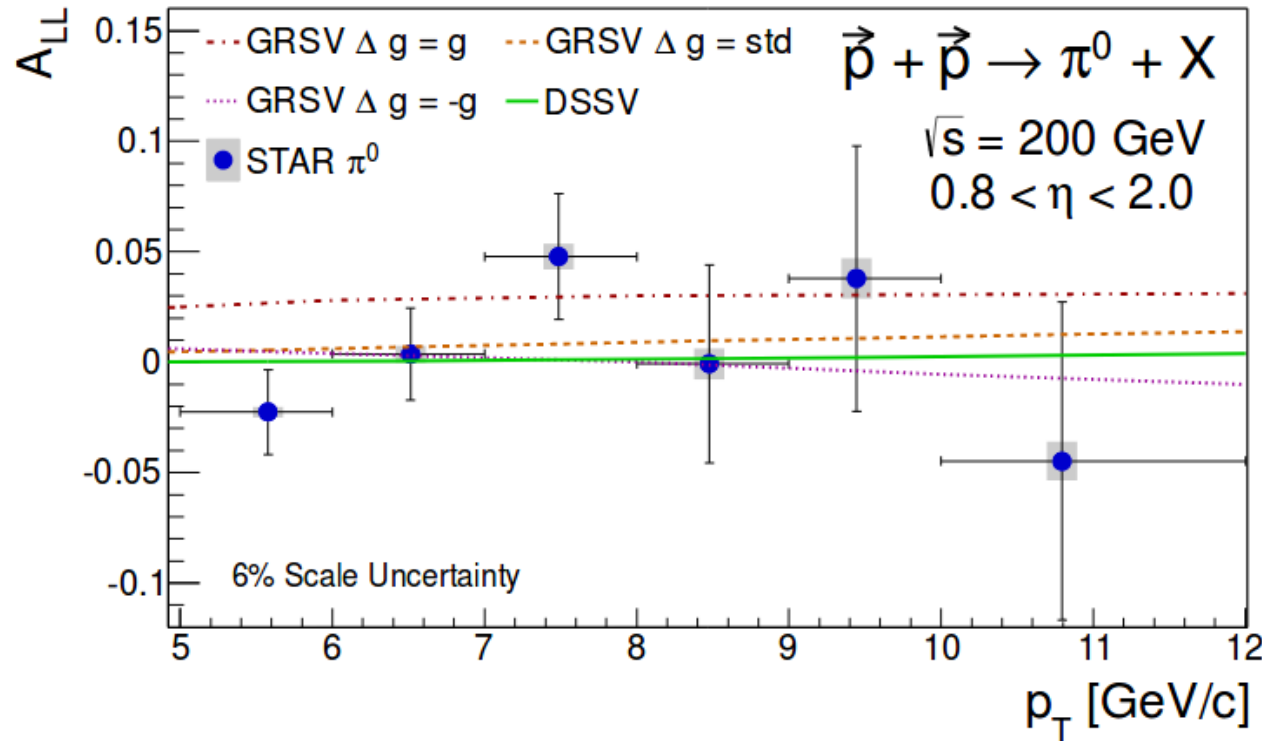

**$x > 0.01$**

# Intermediate Pions at 200 GeV in 2006

Phys.Rev. D89 (2014) no.1, 012001

- ◆ Plotted for pion  $p_T$
- ◆ Agrees with models for varying degrees of gluon polarization
- ◆ This is an older result (pre-DSSV14), and data were not yet sensitive to distinguish between available models
- ◆ Analysis 510 GeV data from 2012 and 2013 is underway; it is sensitive down to  $x \sim 0.004$

**$x > 0.01$**

- ◆ Pions at 510 GeV in 2012 and 2013  
Phys.Rev.D 98 (2018) no.3, 032013  
**\* new result!**

- ◆ Pions at 200 GeV in 2015  
Analysis Underway

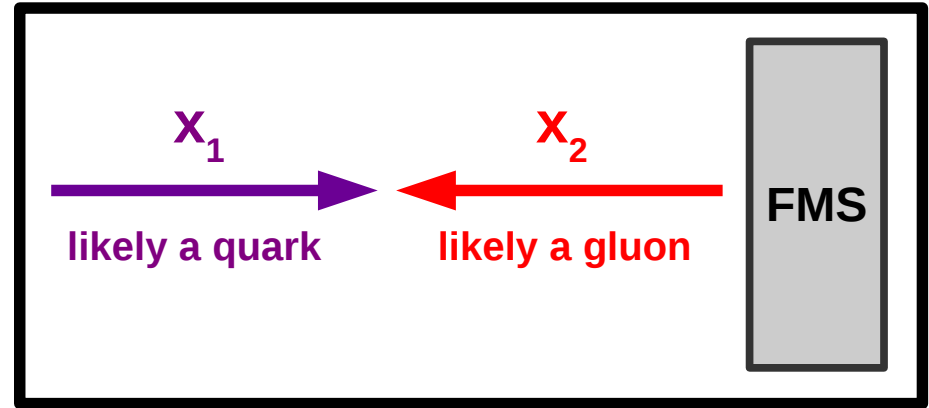

- ◆ Dijets et al. in the Forward Upgrade for 2021+  
Analysis for the Future

# Forward Meson Spectrometer

- Pb-Glass EM Calorimeter
- Primarily sensitive to  $\pi^0$ s
- Analyzed 4  $p_T$  bins in two  $\eta$  regions
- $p_T$  bins chosen to equalize yields in each

## FMS Schematic

C. Dilks

Outer  
Region

Inner  
Region

## Sampled x ranges

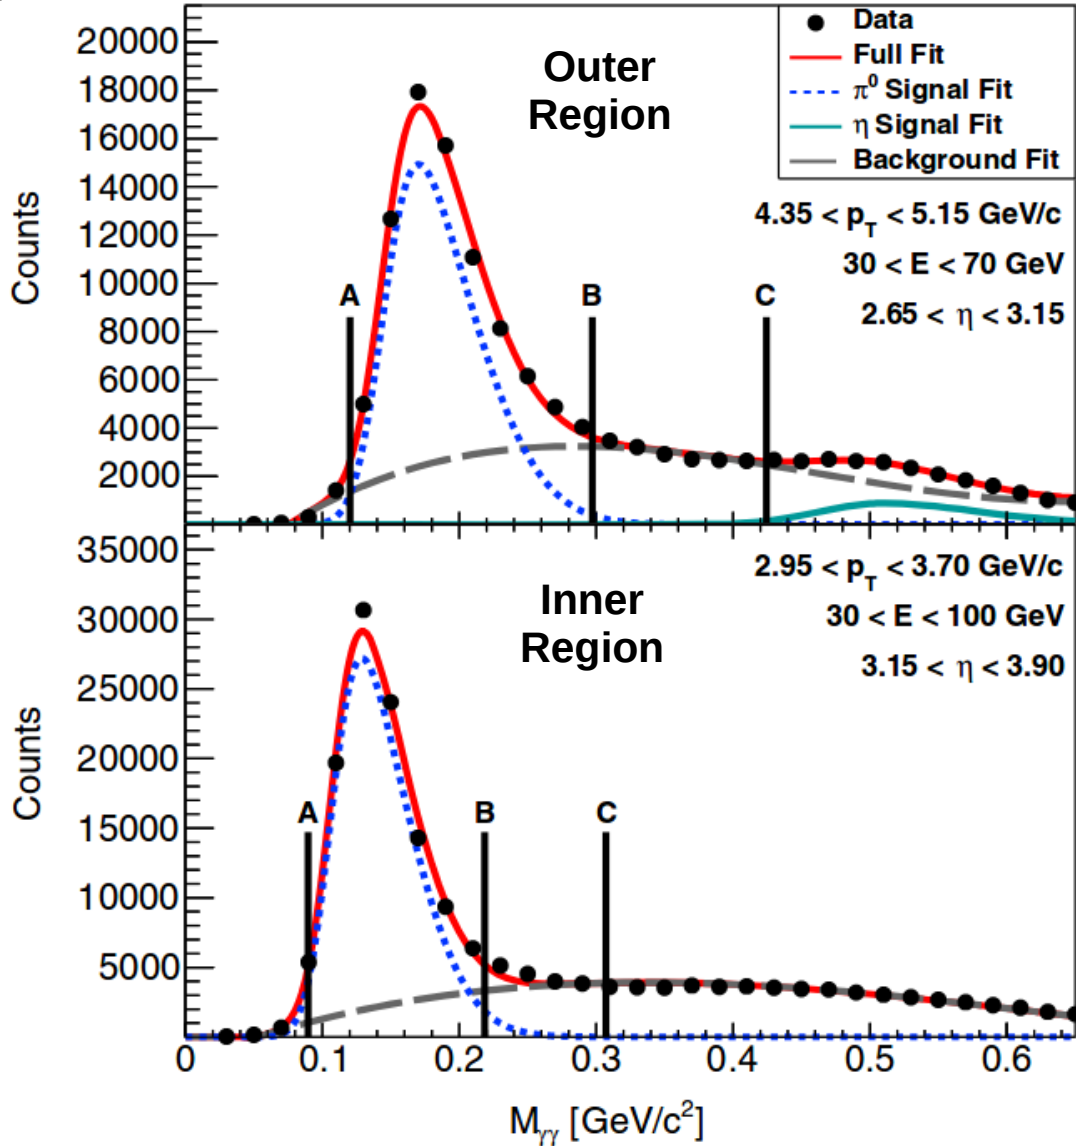

Gluon Helicity at STAR

# Pion Event Sample

## 2-photon Invariant Mass

- Mass Region [AB] – Pions
- Region [BC] – Sideband, for BG
- BG corrections applied to  $A_{LL}$

Full  $A_{LL}$  from  $\pi^0$  mass window

BG  $A_{LL}$  from sideband mass window

Extracted  $\pi^0$  Signal  $A_{LL}$

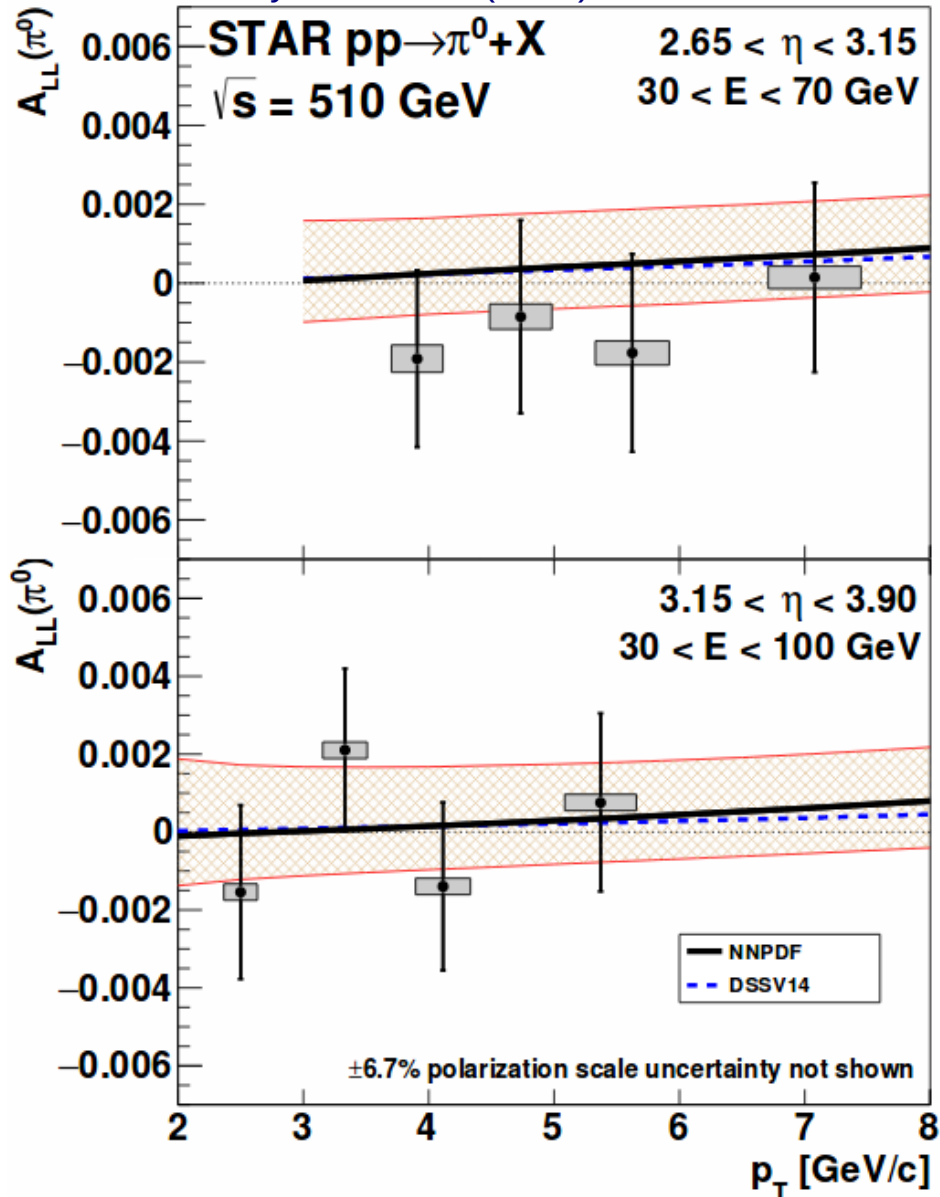

$$A_{LL}^{\pi^0} = \frac{1}{F} \cdot A_{LL}^{\text{Tot}} - \frac{1-F}{F} \cdot A_{LL}^{\text{BG}}$$

$F = \pi^0$  Purity: fraction of events in  $\pi^0$  mass window which are likely  $\pi^0$ s

# Forward Pions at 510 GeV in 2012 & 2013

Phys.Rev.D 98 (2018) no.3, 032013

- ◆ Pushing even farther forward probes  $x$  down to 0.001
- ◆ Provides constraints to the unexplored low- $x$  region, which is *abundant* with soft gluons
- ◆ Shown for two pseudorapidity regions
- ◆ Analysis for 200 GeV is underway, and although it will not probe to as low of  $x$ , it will help improve constraints on  $\Delta g(x)$

**$x > 0.001$**

# Forward Upgrade for 2021+

STAR Note SN0648 – The STAR Forward Calorimeter System and Forward Tracking System

**$x > 0.001$**

- ◆ Plans for a forward tracking system for charged hadrons
- ◆ Plans for upgraded forward calorimeters: EM and Hadronic
- ◆ Forward (di)jets will help more precisely probe  $\Delta g(x)$  down to  $x \sim 0.001$
- ◆ See Kenneth Barish's talk for more info

# Summary: Recent $A_{LL}$ Measurements

$\sqrt{s}$ (GeV)	RHIC Run	Central Jets	Central Dijets	Interm. Dijets	Interm. Pions	Forward Pions	Forward Dijets
200	2006	Published* x>0.05			Published x>0.01		n/a
200	2009	Published x>0.05	Published x>0.05	Published x>0.01			n/a

# Recent RHIC Longitudinal pp Runs

- ◆ Run 6 – 2006 – 200 GeV
- ◆ Run 9 – 2009 – 200 GeV
- ◆ Run 12 – 2012 – 510 GeV
- ◆ Run 13 – 2013 – 510 GeV
- ◆ Run 15 – 2015 – 200 GeV

$$A_{LL}^{\pi^0} = \frac{d\Delta\sigma^{pp \rightarrow \pi^0 X} / dK}{d\sigma^{pp \rightarrow \pi^0 X} / dK} = \frac{\sum_{f_1, f_2, f_3} \Delta f_1 \otimes \Delta f_2 \otimes \left[ d\hat{\sigma}^{f_1 f_2 \rightarrow f_3 X'} \hat{a}_{LL}^{f_1 f_2 \rightarrow f_3 X'} \right] \otimes D_{f_3}^{\pi^0}}{\sum_{f_1, f_2, f_3} f_1 \otimes f_2 \otimes d\hat{\sigma}^{f_1 f_2 \rightarrow f_3 X'} \otimes D_{f_3}^{\pi^0}}$$

# Measuring $A_{LL}$ in pp Scattering

$$A_{LL} = \frac{1}{P_a P_b} \frac{\sigma_{++} + \sigma_{--} - \sigma_{+-} - \sigma_{-+}}{\sigma_{++} + \sigma_{--} + \sigma_{+-} + \sigma_{-+}}$$

proton beam polarizations

$$P = \frac{I_+ - I_-}{I_+ + I_-}$$

measured by RHIC polarimetry

**Luminosity:**  $L = \frac{dN/dt}{\sigma} \Rightarrow \sigma = \frac{N}{L_{int}}$

**Relative Luminosity:**  $R_3 = \frac{L_{++} + L_{--}}{L_{+-} + L_{-+}}$

$$A_{LL} = \frac{1}{P_a P_b} \frac{N_{++} + N_{--} - R_3 (N_{+-} + N_{-+})}{N_{++} + N_{--} + R_3 (N_{+-} + N_{-+})}$$

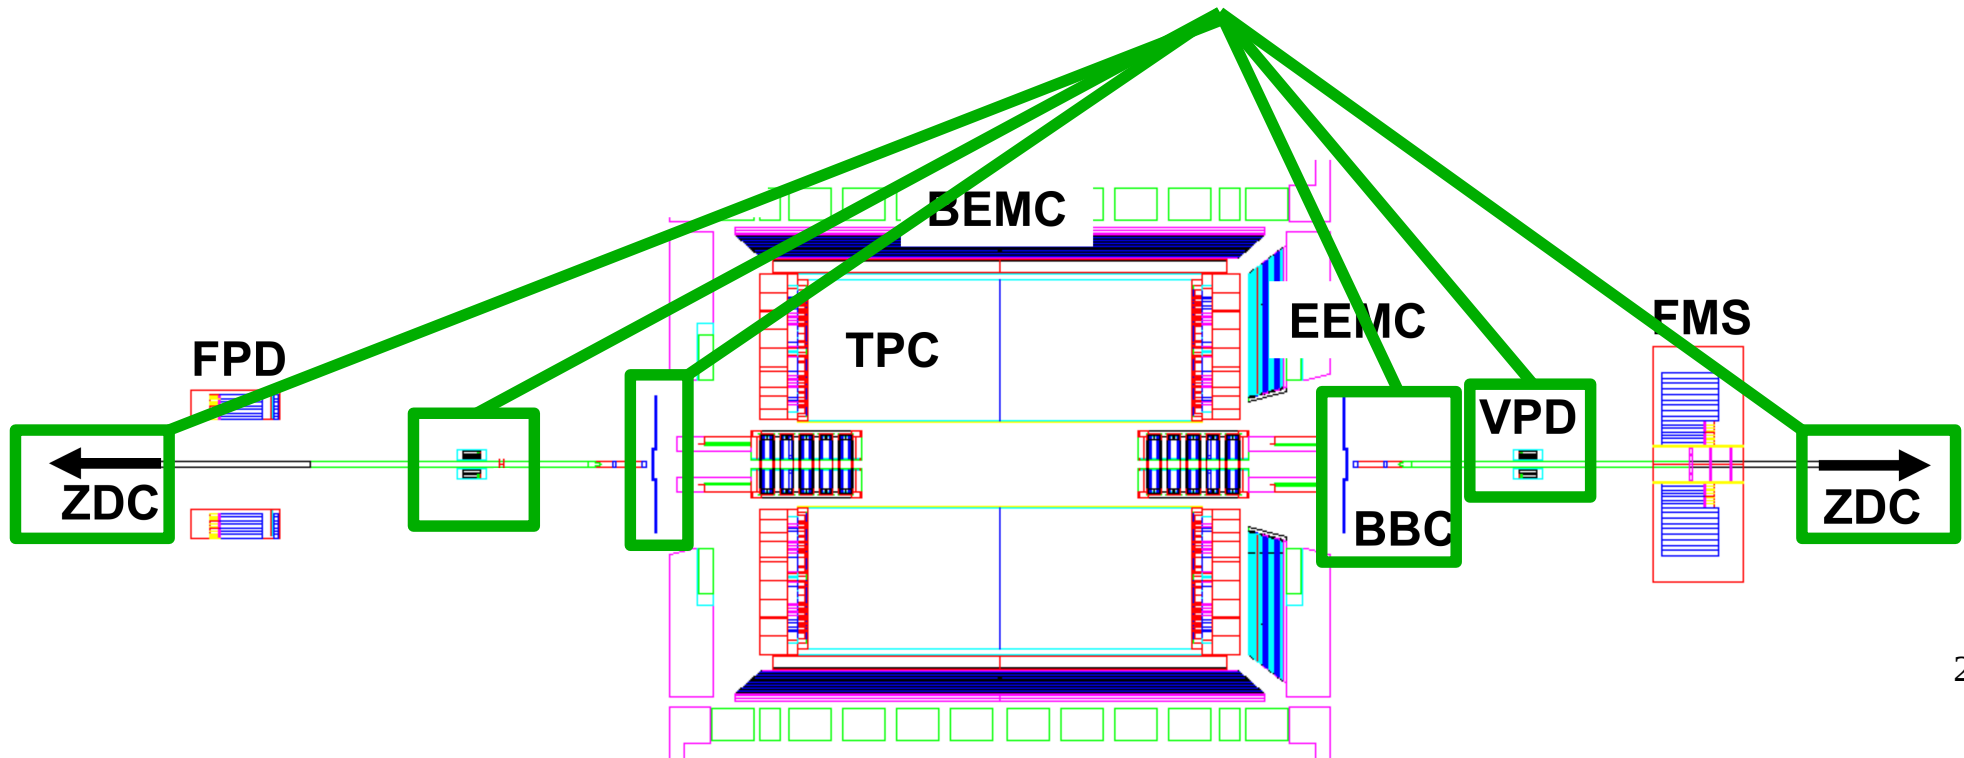

# Measuring Relative Luminosity

3 scaler subsystems for relative luminosity and local polarimetry

We primarily use VPD and ZDC

$$R_3 = \frac{L_{++} + L_{--}}{L_{+-} + L_{-+}}$$

## Scaler Detectors

# Anti- $k_T$ algorithm for jet reconstruction

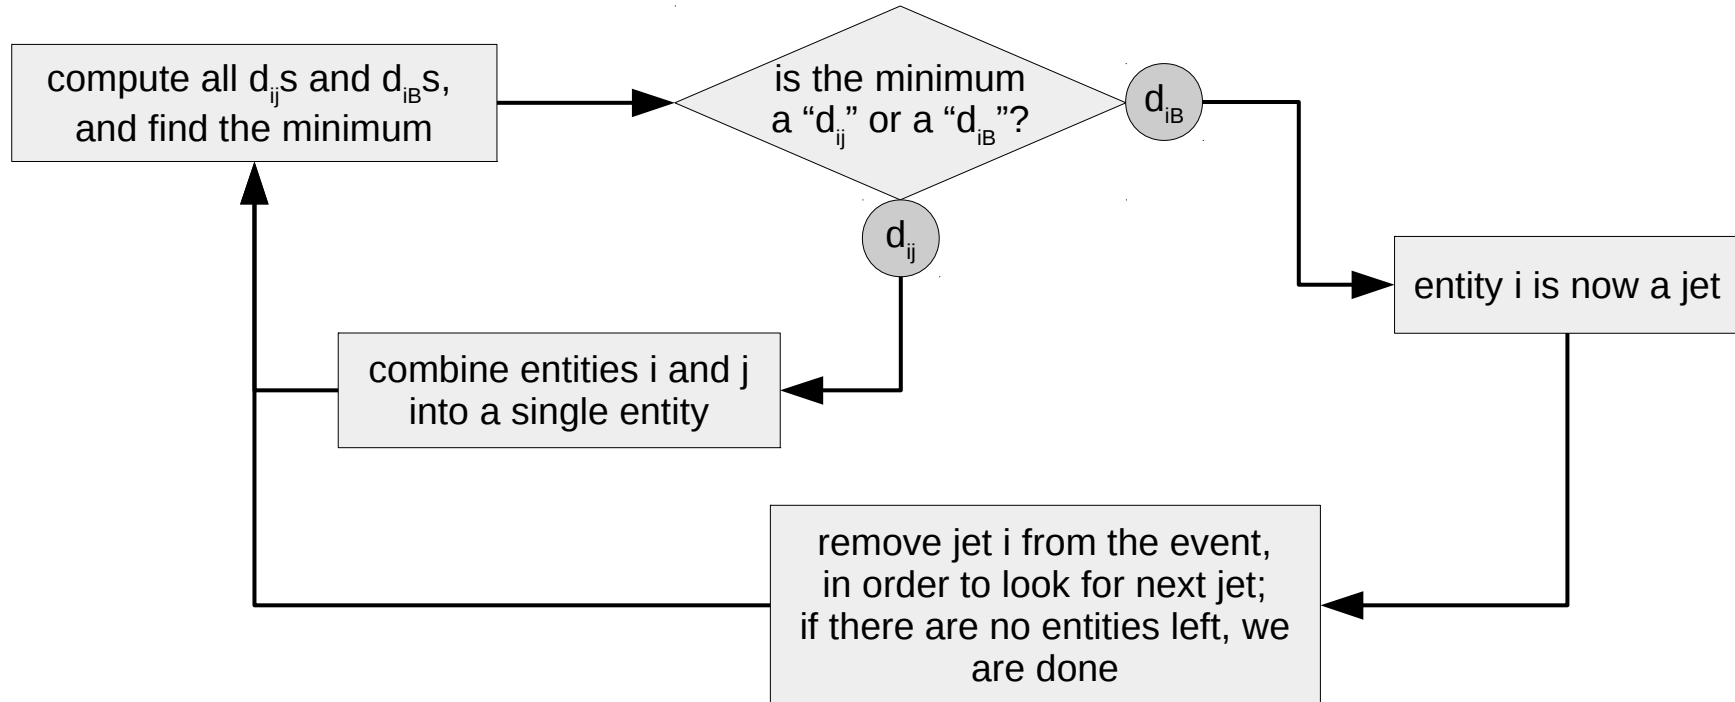

$$d_{ij} = \min \left( \frac{1}{k_{Ti}^2}, \frac{1}{k_{Tj}^2} \right) \cdot \frac{\Delta_{ij}^2}{R^2}$$

$$\Delta_{ij}^2 = (\eta_i - \eta_j)^2 + (\phi_i - \phi_j)^2$$

$$d_{iB} = \frac{1}{k_{Ti}^2}$$

- i and j represent entity (particle, jet, et al) i and j
- $k_{Ti}$  is transverse momentum of entity i
- B represents "beam"
- R is the "resolution parameter"

R scales  $d_{ij}$  with respect to  $d_{iB}$ : any 2 jets are separated by at least  $\Delta=R$

# Anti-kT Algorithm Example

Source: JHEP 0804 (2008) 063

- Example: few hard particles and many soft particles
- $d_{1j}$  between hard particle “1” and soft particle “j” ( $k_{T1} \gg k_{Tj}$ ):
- If entity “1” was instead a soft particle ( $k_{T1} \approx k_{Tj}$ ),  $d_{1j}$  would be much larger
- Result: soft particles tend to cluster with hard particles before they cluster with each other
- If a hard particle has no other hard particles within a distance of  $2R$ , then it accumulates all soft particles within a circle of radius  $R$ , forming a (conical) jet

If another hard particle 2 is present such that  $R < \Delta_{12} < 2R$  then there will be two hard jets. It is not possible for both to be perfectly conical. If  $k_{t1} \gg k_{t2}$  then jet 1 will be conical and jet 2 will be partly conical, since it will miss the part overlapping with jet 1. Instead if  $k_{t1} = k_{t2}$  neither jet will be conical and the overlapping part will simply be divided by a straight line equally between the two. For a general situation,  $k_{t1} \sim k_{t2}$ , both cones will be clipped, with the boundary  $b$  between them defined by  $\Delta R_{1b}/k_{t1} = \Delta_{2b}/k_{t2}$ .

Similarly one can work out what happens with  $\Delta_{12} < R$ . Here particles 1 and 2 cluster to form a single jet. If  $k_{t1} \gg k_{t2}$  then it will be a conical jet centred on  $k_1$ .
