#### Motivation $\rightarrow$ Method

### Motivation $\rightarrow$ Method

- Jet substructure measurements need to be corrected for detector effects for comparison with theory/model.
- Unfolding methods:
  - Iterative Bayesian unfolding (D'Agostini. arXiv:1010.0632 (2010))
  - MultiFold (Andreassen et al. PRL 124, 182001 (2020))
    - Machine learning driven ٠
    - Unbinned •
    - Simulataneously unfold for multiple observables ٠
      - Correlation information is retained

Unfolding

STAR

•  $p_{\rm T}$ : transverse momentum

• 
$$Q^{\kappa} = \frac{1}{(p_{\mathrm{Tjet}})^{\kappa}} \sum_{i \in \mathrm{jet}} q_i \cdot (p_{\mathrm{T}i})^{\kappa} \rightarrow \text{Choose K=2}$$

• 
$$M = |\Sigma_{i \in \text{jet}} p_i| = \sqrt{E^2 - |\vec{p}|^2}$$

4-momentum of the constituent i

Require subjet momentum fraction to pass

$$z_{\rm g} = \frac{\min(p_{\rm T,1}, p_{\rm T,2})}{p_{\rm T,1} + p_{\rm T,2}} > z_{\rm cut} (R_{\rm g}/R_{\rm jet})^{\beta} \qquad \qquad z_{\rm cut} = 0.1$$
  
$$\beta = 0$$

•  $p_{\rm T}$ : transverse momentum

• 
$$Q^{\kappa} = \frac{1}{(p_{\mathrm{Tjet}})^{\kappa}} \sum_{i \in \mathrm{jet}} q_i \cdot (p_{\mathrm{T}i})^{\kappa} \rightarrow \text{Choose K=2}$$

• 
$$M = |\Sigma_{i \in \text{jet}} p_i| = \sqrt{E^2 - |\vec{p}|^2}$$

4-momentum of the constituent i

- $R_g$ : groomed jet radius
- $z_g$ : shared momentum fraction
- *M<sub>g</sub>*: groomed jet mass

SoftDrop grooming

Larkoski, et al. JHEP 2014, 146 (2014). Dasgupta et al. JHEP 2013, 29 (2013). Image credit: <u>Kunnawalkam Elayavalli DIS 2021</u>

Require subjet momentum fraction to pass

$$z_{\rm g} = \frac{\min(p_{\rm T,1}, p_{\rm T,2})}{p_{\rm T,1} + p_{\rm T,2}} > z_{\rm cut} (R_{\rm g}/R_{\rm jet})^{\beta} \qquad \qquad z_{\rm cut} = 0.1$$
  
$$\beta = 0$$

 $R_{\rm iet}$ 

•  $p_{\rm T}$ : transverse momentum

• 
$$Q^{\kappa} = \frac{1}{(p_{\mathrm{Tjet}})^{\kappa}} \sum_{i \in \mathrm{jet}} q_i \cdot (p_{\mathrm{T}i})^{\kappa} \rightarrow \text{Choose K=2}$$

• 
$$M = |\Sigma_{i \in \text{jet}} p_i| = \sqrt{E^2 - |\vec{p}|^2}$$

4-momentum of the constituent i

- $R_g$ : groomed jet radius
- $z_g$ : shared momentum fraction
- *M<sub>g</sub>*: groomed jet mass

All 6 observables are simultaneously unfolded in an unbinned way!

#### SoftDrop grooming

Larkoski, et al. JHEP 2014, 146 (2014). Dasgupta et al. JHEP 2013, 29 (2013). Image credit: <u>Kunnawalkam Elayavalli DIS 2021</u>

Require subjet momentum fraction to pass

$$z_{\rm g} = \frac{\min(p_{\rm T,1}, p_{\rm T,2})}{p_{\rm T,1} + p_{\rm T,2}} > z_{\rm cut} (R_{\rm g}/R_{\rm jet})^{\beta} \qquad \qquad z_{\rm cut} = 0.1$$
  
$$\beta = 0$$

 $R_{\rm iet}$ 

- All 6 observables are simultaneously unfolded! ٠
- Unfolding is **unbinned**. Binning is chosen ٠ afterward for illustration.

#### Jet reconstruction at STAR

#### Jet reconstruction at STAR

Important subdetectors for **pp**  $\sqrt{s}$  = **200 GeV** collisions data-taking during 2012 RHIC run

- **TPC** (Time Projection Chamber)
  - For charged particle track reconstruction
  - $|\eta| < 1$ , full azimuthal coverage
- **BEMC** (Barrel ElectroMagnetic Calorimeter)
  - For **neutral** energy measurement and triggering
  - |η| < 1, full azimuthal coverage</li>
- > Reconstruct anti- $k_T$  full jets
  - Jet resolution parameter **R=0.4**
  - |η<sub>jet</sub>| < 0.6

#### Jet reconstruction at STAR

Important subdetectors for **pp**  $\sqrt{s}$  = **200 GeV** collisions data-taking during 2012 RHIC run

- **TPC** (Time Projection Chamber)
  - For charged particle track reconstruction
  - $|\eta| < 1$ , full azimuthal coverage
- **BEMC** (Barrel ElectroMagnetic Calorimeter)
  - For **neutral** energy measurement and triggering
  - |η| < 1, full azimuthal coverage</li>
- > Reconstruct anti- $k_T$  full jets
  - Jet resolution parameter R=0.4
  - |η<sub>jet</sub>| < 0.6
- Additional selections
- Tracks (Towers):  $0.2 < p_T(E_T) < 30 \text{ GeV}$
- Jets
  - $p_{\rm T}$  > 15 GeV/c, M > 1 GeV/ $c^2$ , neutral  $p_{\rm T}$  fraction < 0.9
  - Passes SoftDrop with  $z_{cut}$  = 0.1 and  $\beta$  = 0

#### Fully corrected jet M

 $M = \left| \sum_{i \in \text{jet}} p_i \right| = \sqrt{E^2 - p^2},$ 

MultiFold result agrees with RooUnfold result (STAR Collaboration. PRD 104, 052007(2021))

**HEPData** 

Hot Quarks, 10/15/22

#### Fully corrected jet $M vs Q vs p_T$

$$Q_J = \frac{1}{(p_{\mathrm{T}_J})^{\kappa}} \sum_{i \in Tracks} q_i \times (p_{\mathrm{T},i})^{\kappa} | M = \left| \sum_{i \in \mathrm{jet}} p_i \right| = \sqrt{E^2 - p^2},$$

Jet M increases with increasing jet  $p_T \rightarrow$  Higher  $p_T$  means larger phase space for radiation Jet M increases with decreasing jet  $|Q| \rightarrow$  High  $p_T$  track contributes more to jet  $|Q| \rightarrow$  Wider jets tend to have lower |Q|

STAR

#### Fully corrected jet $M vs Q vs p_T$

$$\left[Q_J = \frac{1}{(p_{\mathrm{T}_J})^{\kappa}} \sum_{i \in Tracks} q_i \times (p_{\mathrm{T},i})^{\kappa} \right] M = \left| \sum_{i \in \mathrm{jet}} p_i \right| = \sqrt{E^2 - p^2},$$

Jet M increases with increasing jet  $p_T \rightarrow$  Higher  $p_T$  means larger phase space for radiation Jet M increases with decreasing jet  $|Q| \rightarrow$  High  $p_T$  track contributes more to jet  $|Q| \rightarrow$  Wider jets tend to have lower |Q|

STAR

### Summary and outlook

- <u>First measurement</u> in pp that uses machine learning based method for unfolding
  - Multi-dimensional and unbinned
  - Nice agreement with RooUnfold
  - Ideal for correlation measurement

### Summary and outlook

- <u>First measurement</u> in pp that uses machine learning based method for unfolding
  - Multi-dimensional and unbinned
  - Nice agreement with RooUnfold
  - Ideal for correlation measurement

- Fully-corrected measurement of jet  $M \operatorname{vs} Q \operatorname{vs} p_T$  in  $\sqrt{s} = 200 \text{ GeV}$  pp collisions.
  - Jet *M* increases with increasing  $p_T$ ; jet *M* increases with decreasing |Q|.
  - **PYTHIA8 Detroit tune** describes the data well; **HERWIG7** underpredicts jet M for large |Q|.

### Summary and outlook

- <u>First measurement</u> in pp that uses machine learning based method for unfolding
  - Multi-dimensional and unbinned
  - Nice agreement with RooUnfold
  - Ideal for correlation measurement

- Fully-corrected measurement of jet  $M \operatorname{vs} Q \operatorname{vs} p_T$  in  $\sqrt{s} = 200 \text{ GeV}$  pp collisions.
  - Jet *M* increases with increasing  $p_T$ ; jet *M* increases with decreasing |Q|.
  - **PYTHIA8 Detroit tune** describes the data well; **HERWIG7** underpredicts jet M for large |Q|.
- Future directions
  - Jet substructure correlation measurements allow separation of jets with different fragmentation patterns → measure formation time, charge-charge correlator, collinear SoftDrop mass...
  - 6-dimensional jet information may allow us to separate quark vs gluon jets → apply additional machine learning for classification...

Hot Quarks, 10/15/22

- Architechture: Dense neural network Activation function for dense layers: Rectified linear unit
- Activation function for output layer: Sigmoid
- Loss function: Binary cross entropy

$$\log(f(x)) = -\sum_{i \in \mathbf{0}} \log f(x_i) - \sum_{i \in \mathbf{1}} \log(1 - f(x_i))$$

- Optimization algorithm: Adam <u>https://arxiv.org/pdf/1412.6980.pdf</u>
- Nodes per dense layer: [100,100,100]
- Output dimension: 2
- Input dimension: 6
- All hyperparameters are default: <u>https://energyflow.network/docs/archs/#dnn</u>

Activation function for dense layers: Rectified linear unit  $f(x) = x^+ = \max(0, x)$ 

#### https://energyflow.network/docs/archs/

#### **Compilation Options**

- loss= 'categorical\_crossentropy' : str
  - The loss function to use for the model. See the Keras loss function docs for available loss functions.
- **optimizer=** 'adam' : Keras optimizer or str
  - A Keras optimizer instance or a string referring to one (in which case the default arguments are used).
- metrics= ['accuracy'] : list of str
  - The Keras metrics to apply to the model.
- compile\_opts= {} : dict
  - Dictionary of keyword arguments to be passed on to the compile method of the model. loss, optimizer, and metrics (see above) are included in this dictionary. All other values are the Keras defaults.

#### **Output Options**

- output\_dim= 2 : int
  - $\circ~$  The output dimension of the model.
- output\_act= 'softmax' : str or Keras activation
- Activation function to apply to the output.

#### **Callback Options**

- filepath= None : str
  - $\circ~$  The file path for where to save the model. If  $\ensuremath{\left| \ensuremath{\mathsf{None}} \ensuremath{\right|}}$  then the model will not be saved.
- save\_while\_training= True : bool
  - Whether the model is saved during training (using the ModelCheckpoint callback) or only once training terminates. Only relevant if filepath is set.
- save\_weights\_only= False : bool
  - $\circ~$  Whether only the weights of the model or the full model are saved. Only relevant if  $\fbox{filepath}$  is set.
- modelcheck\_opts= {'save\_best\_only':True, 'verbose':1} : dict
  - Dictionary of keyword arguments to be passed on to the ModelCheckpoint callback, if it is present.
     save\_weights\_only (see above) is included in this dictionary. All other arguments are the Keras defaults.
- patience= None : int
  - The number of epochs with no improvement after which the training is stopped (using the EarlyStopping callback). If None then no early stopping is used.
- earlystop\_opts= {'restore\_best\_weights':True, 'verbose':1} : dict
  - Dictionary of keyword arguments to be passed on to the EarlyStopping callback, if it is present. patience (see above) is included in this dictionary. All other arguments are the Keras defaults.

#### https://energyflow.network/docs/archs/#dnn Required DNN Hyperparameters

- input\_dim : int =6
  - $\circ~$  The number of inputs to the model.
- dense\_sizes : {tuple, list} of int = [100,100,100]
  - $\circ\,$  The number of nodes in the dense layers of the model.

#### Default DNN Hyperparameters

- acts= 'relu' : {tuple, list} of str or Keras activation
  - Activation functions(s) for the dense layers. A single string or activation layer will apply the same activation to all dense layers. Keras advanced activation layers are also accepted, either as strings (which use the default arguments) or as Keras <a href="mailto:Layer">Layer</a> instances. If passing a single <a href="mailto:Layer">Layer</a> instance, be aware that this layer will be used for all activations and may introduce weight sharing (such as with <a href="mailto:PReLU">PReLU</a>); it is recommended in this case to pass as many activations as there are layers in the model. See the Keras activations does for more detail.
- **k\_inits=** 'he\_uniform' : {*tuple*, *list*} of *str* or Keras initializer
  - Kernel initializers for the dense layers. A single string will apply the same initializer to all layers. See the Keras initializer docs for more detail.
- dropouts= 0 : {tuple, list} of float
  - Dropout rates for the dense layers. A single float will apply the same dropout rate to all layers. See the Keras Dropout layer for more detail.
- **I2\_regs=** : {tuple, list} of float

#### Closure test for unfolding

• Step 1: Separate matched jets from PYTHIA and PYTHIA+GEANT into 2 samples

Hot Quarks, 10/15/22

Х

### Closure test for unfolding: results

Decent **closure** for all substructure observables

٠

STAR

Unfolding unc. on data (not including misses)

Stat. unc. on sample 1

### Systematic uncertainties

- Detector uncertainties (correlated with RooUnfold)
  - Hadronic correction 100% -> 50%
  - Tower scale +3.8%
  - Tracking efficiency -4%
- Unfolding uncertainties
  - Prior shape variation: Reweight jet mass distributions by HERWIG7 (LHC-UE-EE-4-CTEQ6L1 tune) and PYTHIA8 (Detroit tune)
  - Unfolding seed variation: Due to randomization of the initial weights
  - Iteration number variation

#### What's the best purity we can achieve for q vs g separation?

- In 20 < pT < 30 GeV, gluon fraction ~ 35%</p>
- To select a jet population with gluon fraction = 67%, cut on -0.025 < Q < 0 AND M > 7 GeV. (1.1% of all jets).
  - If we only cut on M > 7 GeV, gluon fraction = 58%. (Although we will have higher statistics).
  - If we want to reach gluon fraction = 67% with just a M cut, need M > 8.6 GeV. (0.8% of all jets).
- In 30 < pT < 50 GeV, gluon fraction ~ 20%</p>
- > To select a jet population with gluon fraction = 65%, cut on -0.08 < Q < -0.01 AND M > 9 GeV. (1.1%).
  - $\succ$  No cut on jet M/Q alone can achieve such a purity.
