Forward π^0 and η production in STAR at $\sqrt{s}$= 500 GeV with transversely polarized pp collisions

Transverse momentum Dependence of π^0 SSA in FMS Run 11

CIPANP

S. Heppelmann (PSU) for STAR collaboration

June 2 , 2012

- Background
  - Physics Questions
  - FMS History
- FMS Event Topology; Event Selection
- **Cross Ratio** method

  vs.

  $\mathbf{A(\phi)=A_N \cos(\phi)}$ Fitting method

- Explore high statistics A_N for Run 11
  - P_T dependence for fixed X_F
  - Dependence on event topology

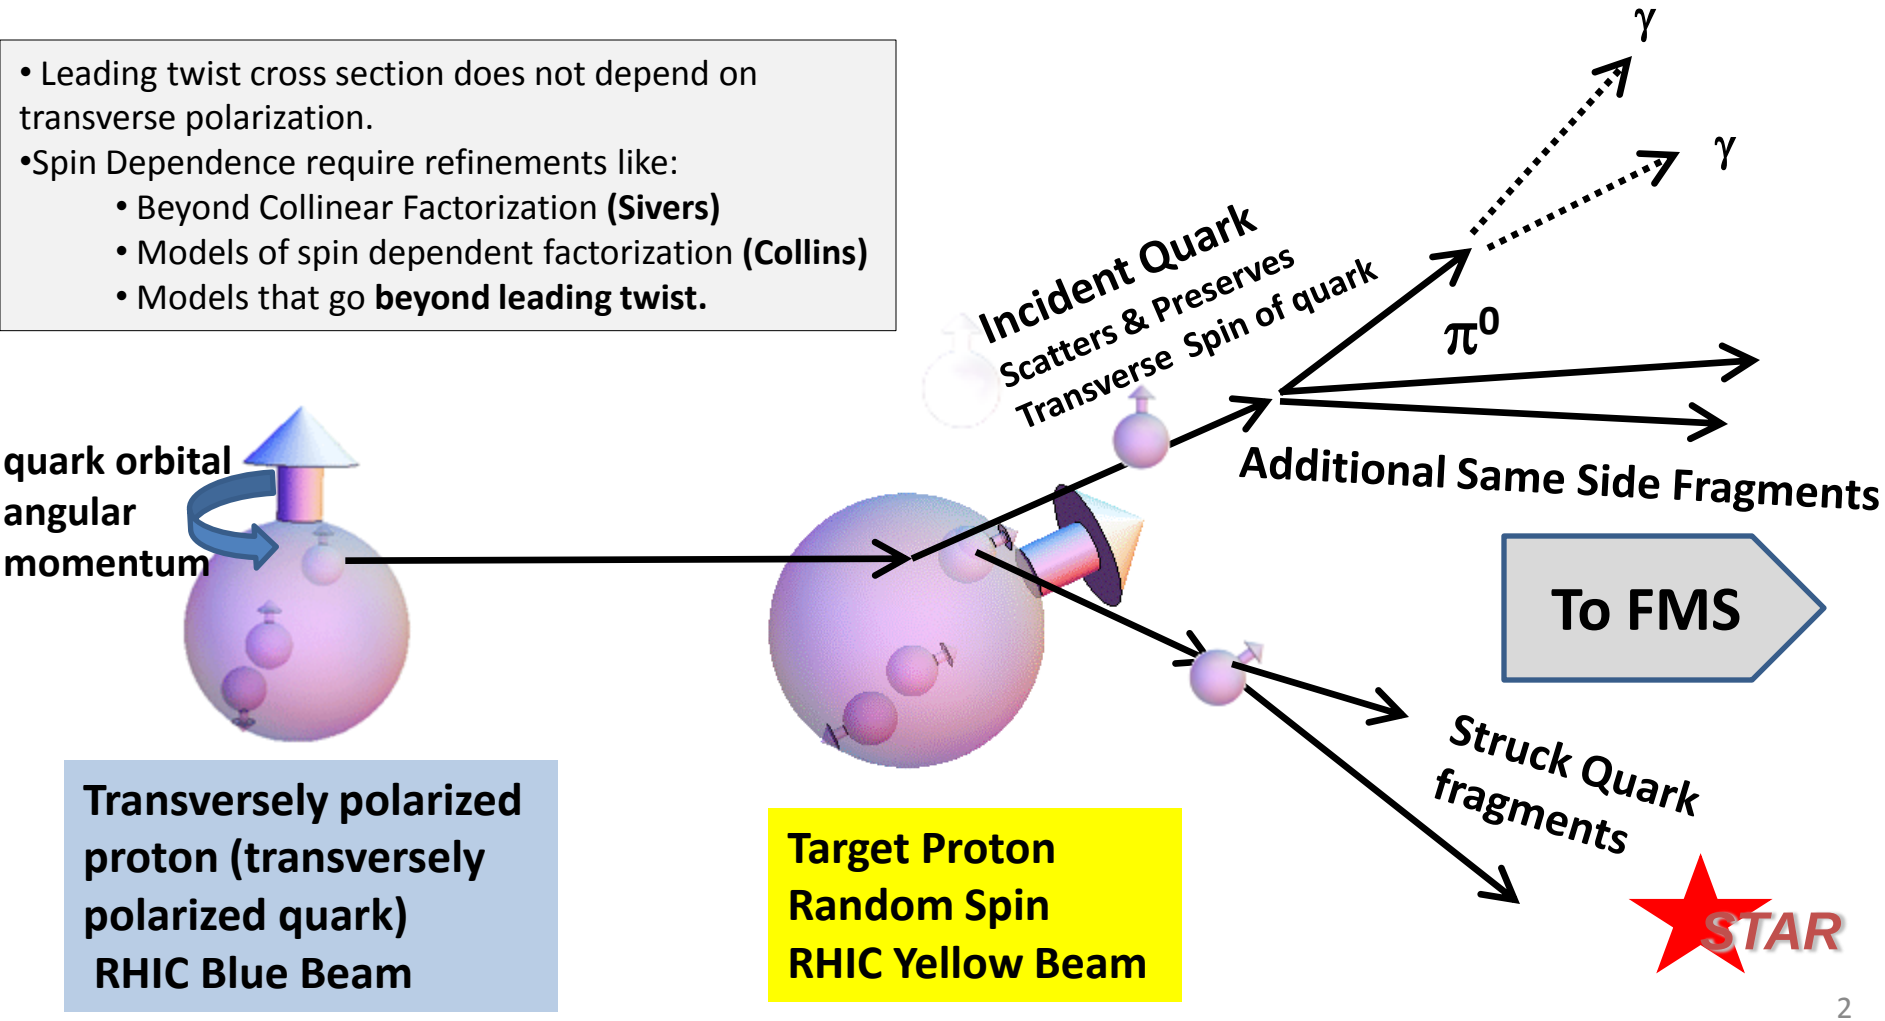
Proton Forward Scattering at High PT
QCD Perspective

PQCD (Leading Twist):

Factorized Cross Section= (initial state) x (quark scattering) x (fragmentation)

• Does good job of predicting the "> 90% " of the cross section that does not depend on spin.

• Leading twist cross section does not depend on transverse polarization.
•Spin Dependence require refinements like:
- Beyond Collinear Factorization **(Sivers)**
- Models of spin dependent factorization **(Collins)**
- Models that go **beyond leading twist.**



Transversely polarized proton (transversely polarized quark) RHIC Blue Beam

Target Proton Random Spin RHIC Yellow Beam

FMS

Pb Glass EM Calorimeter
pseudo-rapidity 2.7<η<4.0
Small cells: 3.81x3.81 cm
Outer cells: 5.81 x 5.81 cm

STAR

Forward EM Calorimetry In STAR.

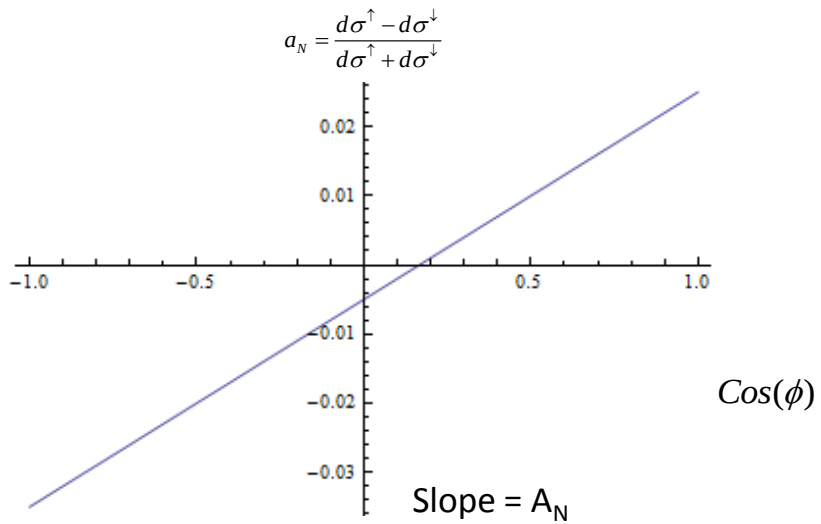
1) Cross Ratio Transverse Asymmetry

vs

2) A(ϕ) Fit

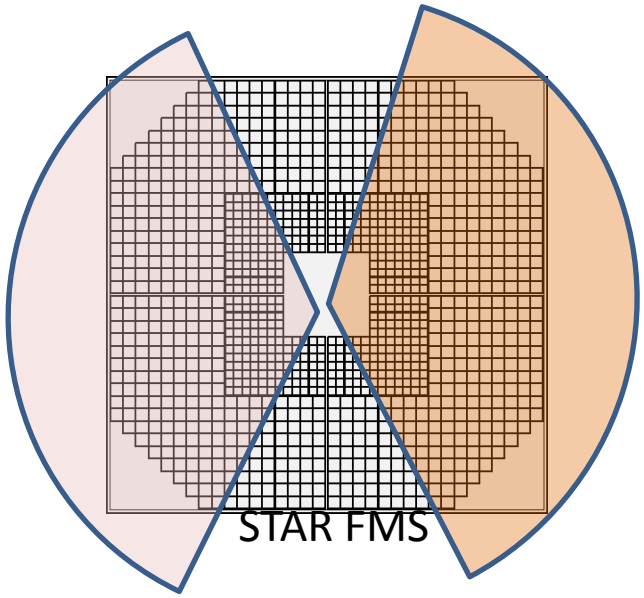
Method 1:
Cross Ratio:

$$A_N = \frac{d\sigma^{\uparrow} - d\sigma^{\downarrow}}{d\sigma^{\uparrow} + d\sigma^{\downarrow}} \cong \frac{1}{P} \frac{\sqrt{N^{\uparrow}S^{\downarrow}} - \sqrt{S^{\uparrow}N^{\downarrow}}}{\sqrt{N^{\uparrow}S^{\downarrow}} + \sqrt{S^{\uparrow}N^{\downarrow}}}$$



Slope = A_N
Y Intercept=Luminosity Ratio

Left(N): Cos(ϕ)<-0.5



Method 2: $a_N(\phi) = a_0 + A_N \cos(\phi)$

Right(S): Cos(ϕ)>0.5

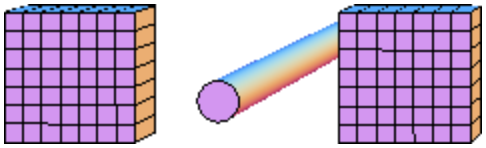
Fix a_0 for full data set

For many small data subsets ….. one parameter fit for A_N

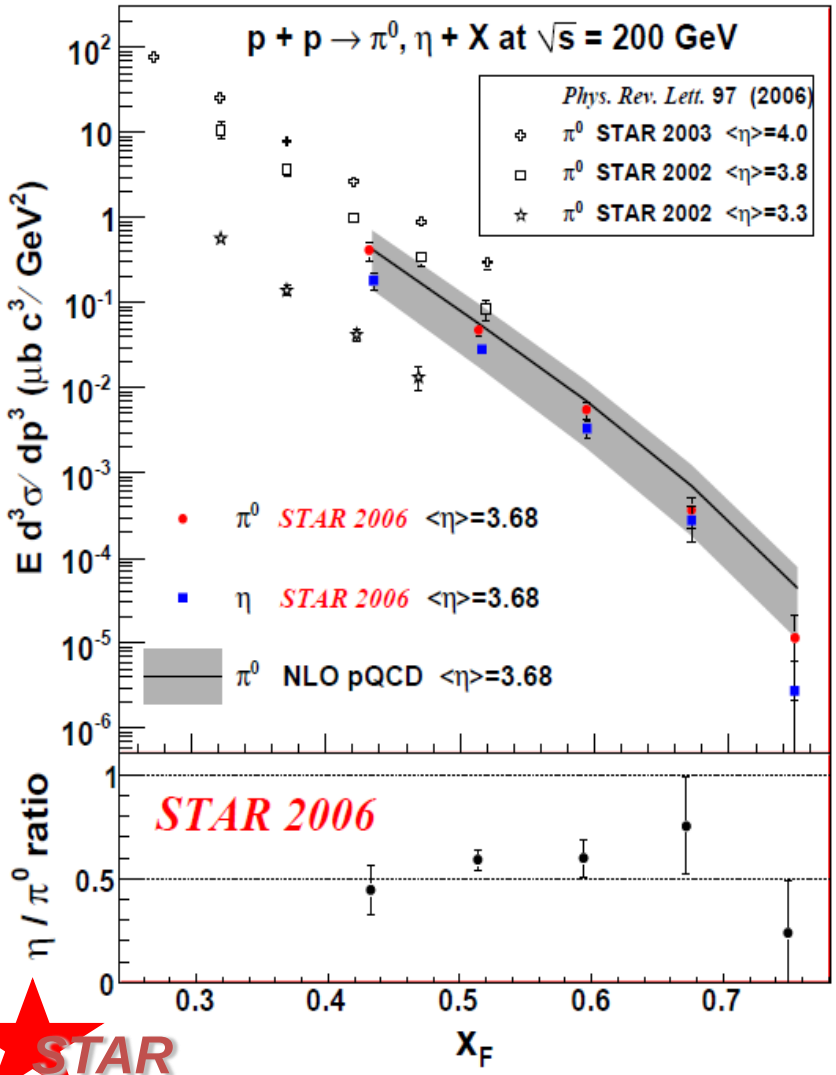
Advantage: Every fitted value of A_N comes with error and chi^2.

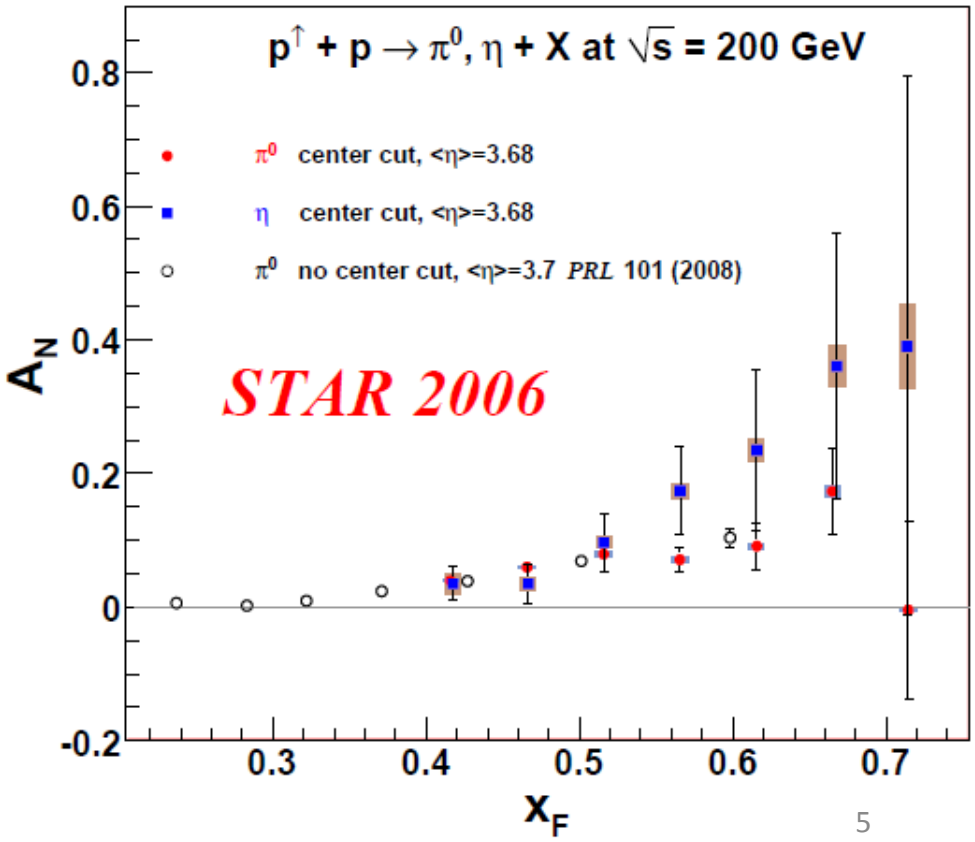
New paper on η/π^0 at X_F>0.5

Extra page 31 is a possible substitute for this slide



- π^0 cross section in **good agreement with PQCD calculation.**
- η/π^0 cross section ratio similar to that observed where jet fragmentation is dominant.
- $A_N(\eta) > A_N(\pi^0)$ for $X_F > 0.55$

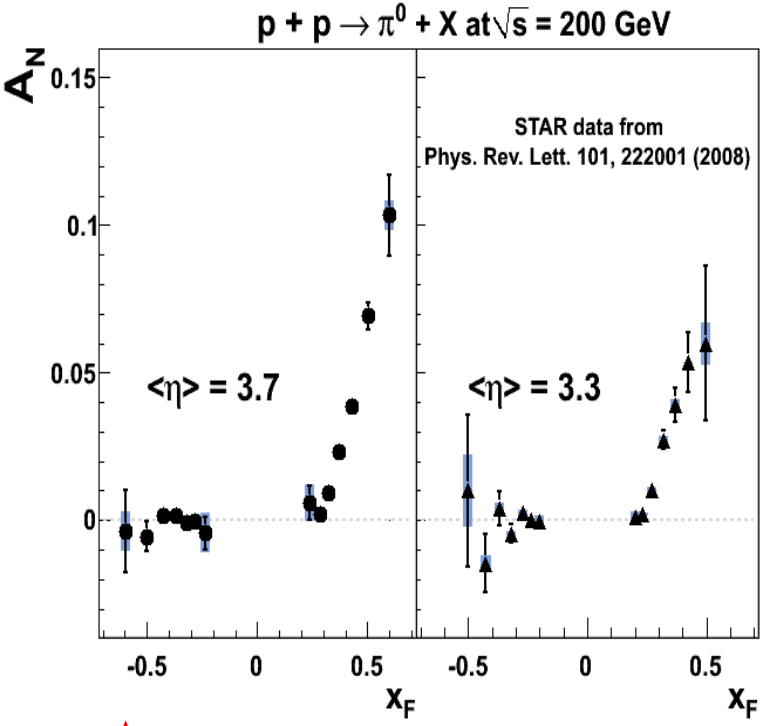


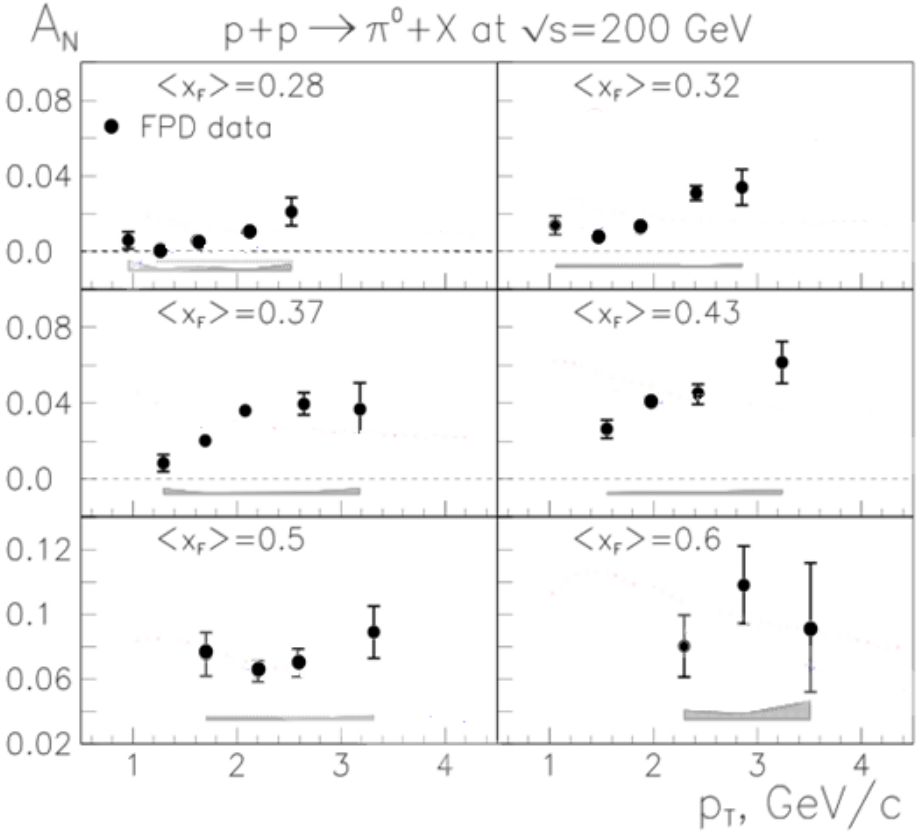


STAR Published Run 6 (FPD √s =200GeV)

PRL 101, 222001 (2006)

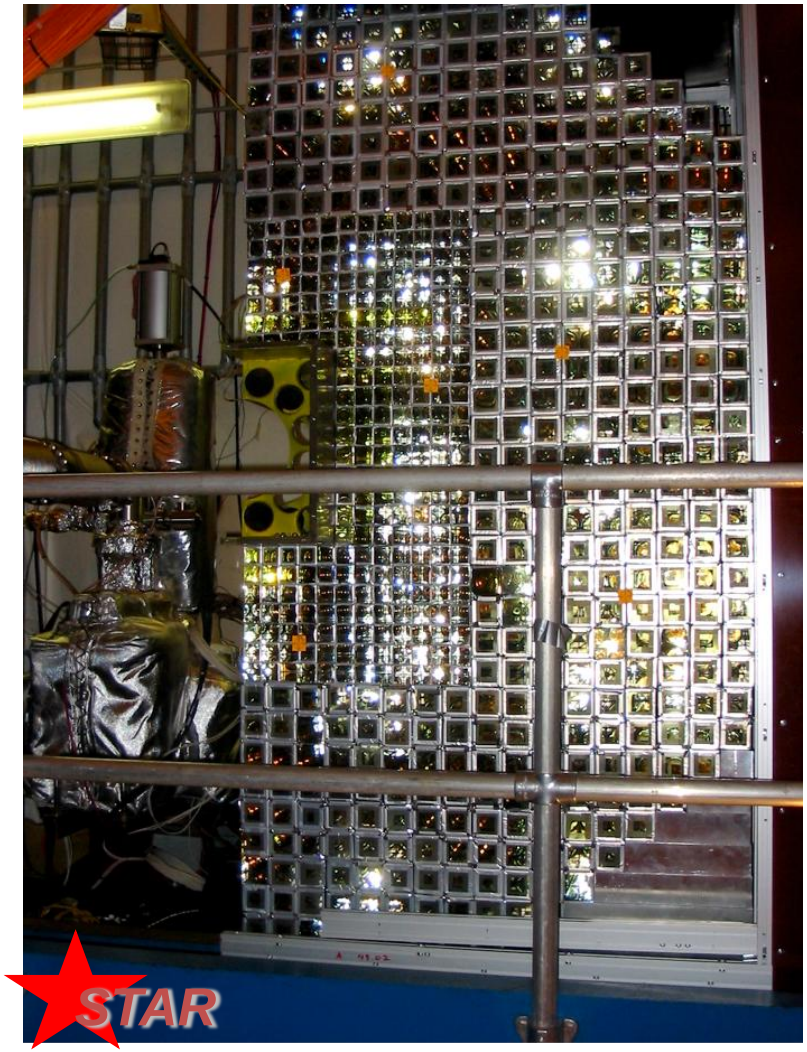
- Rising A_N with X_F ($0<X_F<0.5$) from 0% to 5-10%
- No evidence of fall in A_N with increasing P_T up to P_T ~ 3 GeV/c

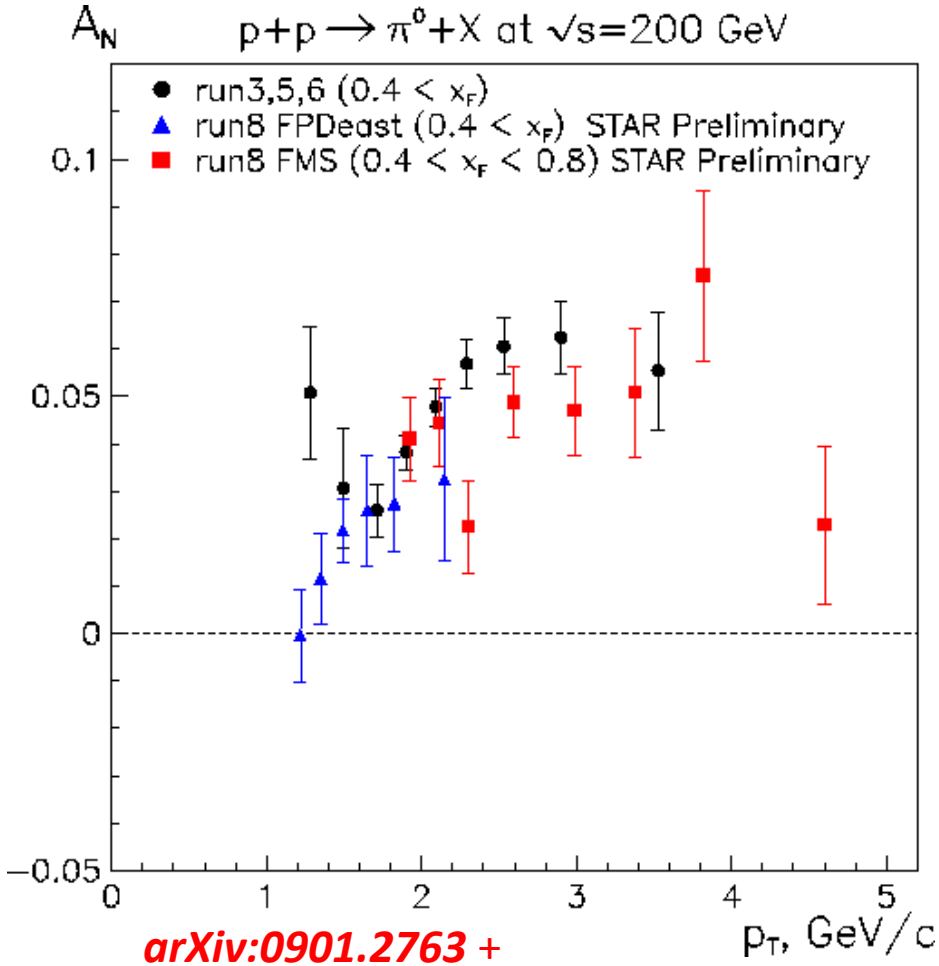




From FMS Run 8, STAR has Expanded Rapidity Coverage -1<Y<4.2

STAR Forward Meson Spectrometer
2.5 < Y < 4.0





arXiv:0901.2763 +
A.Ogawa @CIPANP09

• Leading twist cross section does not depend on transverse polarization.
•Spin Dependence require refinements like:
  • Beyond Collinear Factorization **(Sivers)**
  • Models of spin dependent factorization **(Collins)**
  • Models that go **beyond leading twist.**

Sivers Model: Initial quark picks up k_T from initial state wave function, proportional to orbital angular momentum.

Jet based Asymmetry, significant dependence of A_N on the details of near side jet fragments is not expected!

Collins Model: Final π^0 picks up k_T from fragmentation of polarized quark. Vanishing jet asymmetry. Observed A_N will depend on the details of near side fragmentation!

Transverse momentum $\mathbf{p_T} \Longrightarrow \mathbf{p_T \pm k_T}$
increases/decreases with transverse **spin up/down**

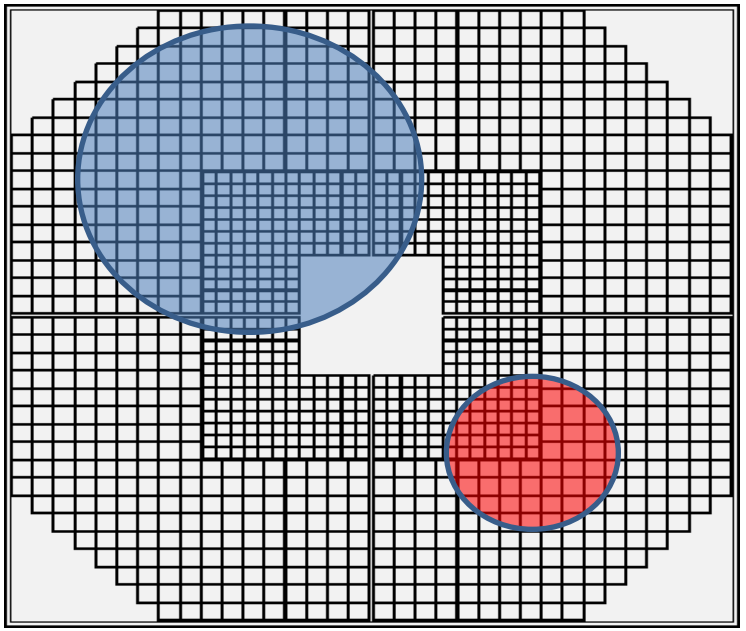
A toy model for proton Cross Section

$$\sigma(p_T) \sim \frac{(1-x_F)^5}{p_T{}^6}$$

$$A_N \sim \frac{\sigma(p_T + k_T) - \sigma(p_T - k_T)}{2\sigma(p_T)} \sim \frac{6k_T}{p_T} \sim \frac{1}{p_T}$$

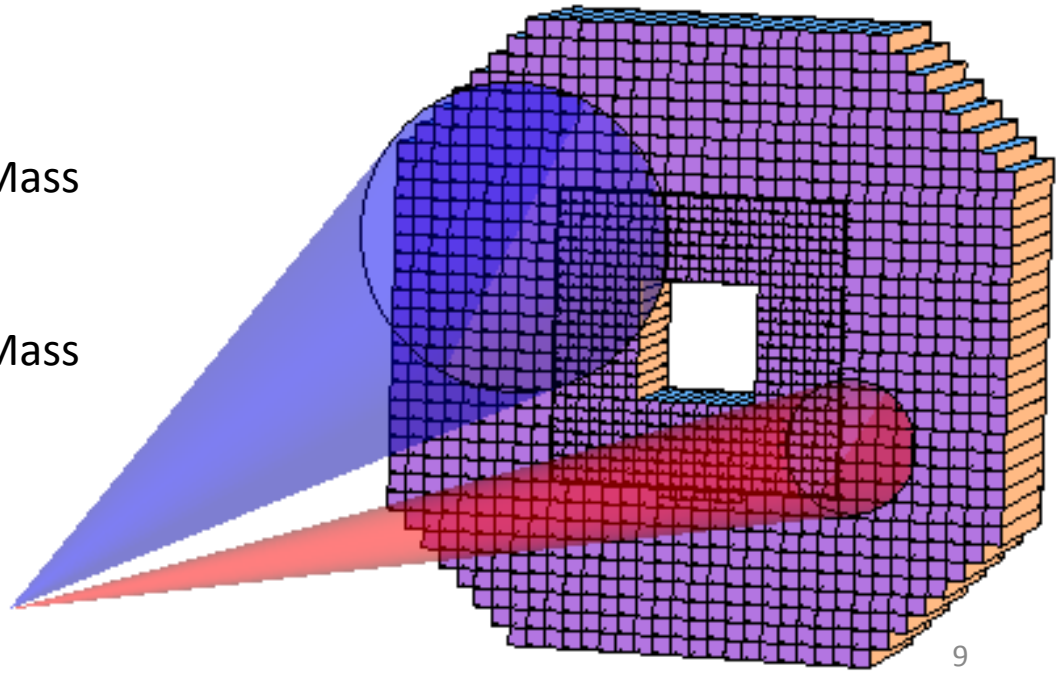
Similar transverse momentum dependence **for higher twist.**

Isolation of π^0 's



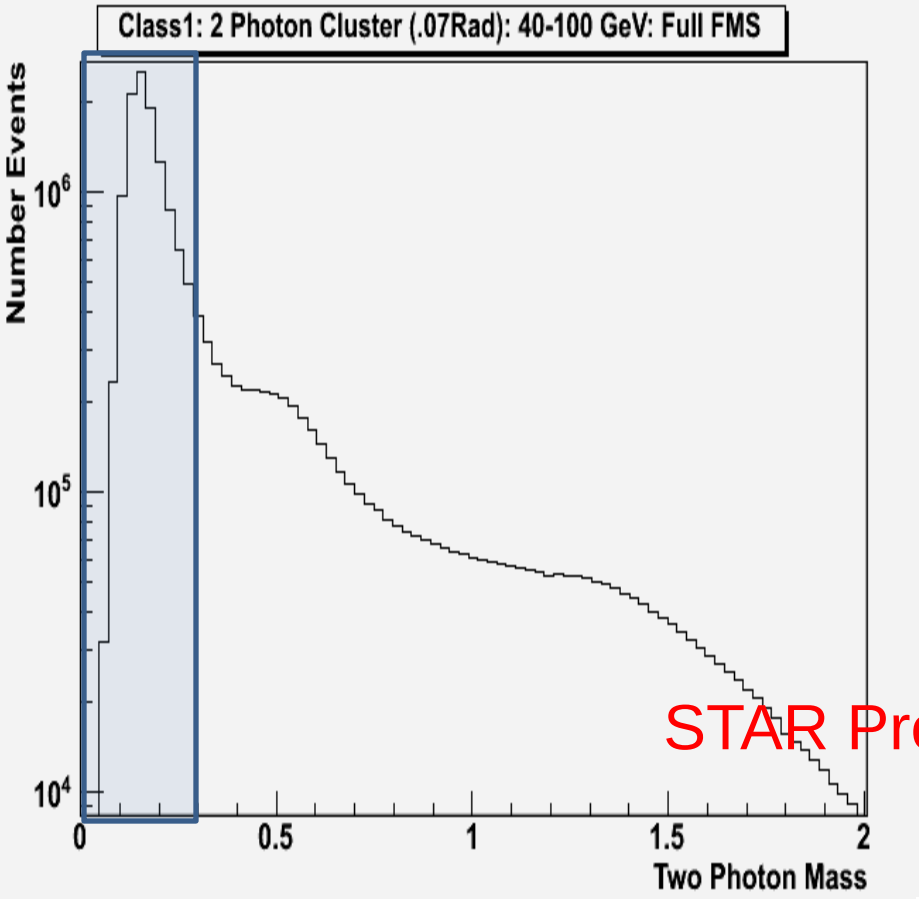
Event Selection:

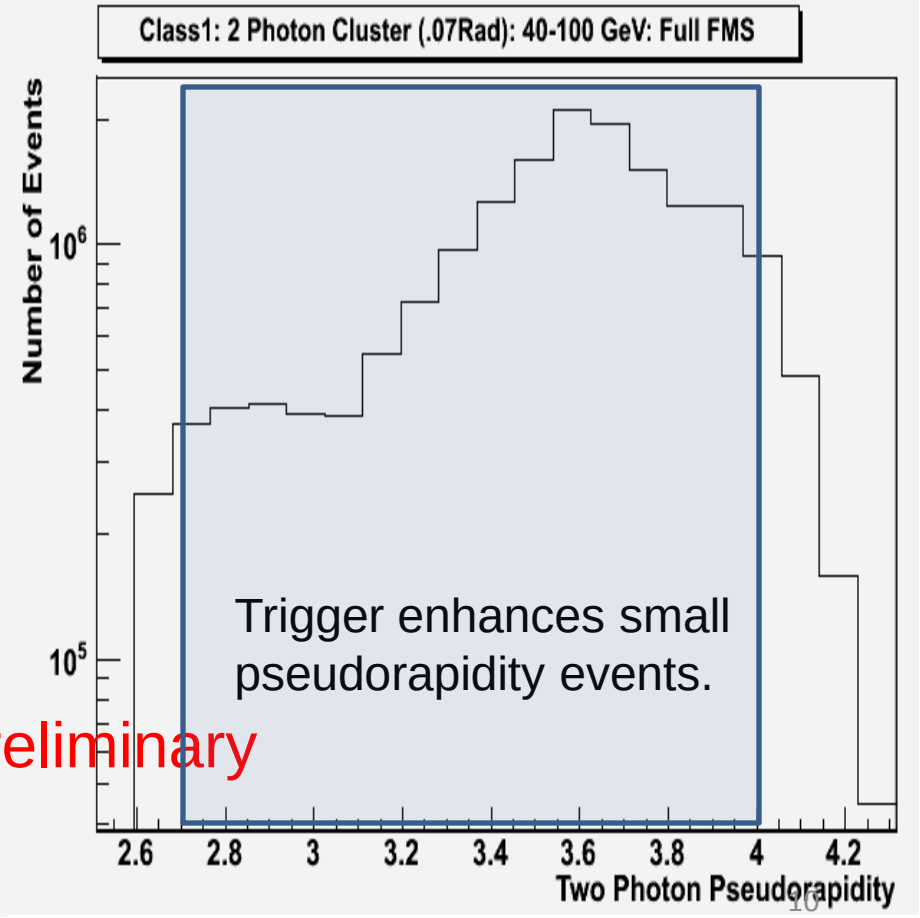
1. **Analyze FMS for all photon** candidates. (Showers that are fit successfully to photon hypothesis)
   A photon candidates must have a minimum of 6 GeV in the small inner detector or 4 GeV in the outer cells.
2. **Find Clusters of EM energy** grouping photon candidates that are within opening angle cone $\Delta\theta$ (relative to energy weighted center)
3. We consider 2 event classes {1 and 2}
   1. $\Delta\theta$ =0.07 2 Photon clusters, Pi0 Mass (**isolation radius of .07 radians**).
   2. $\Delta\theta$ =0.03 2 Photon clusters ,Pi0 Mass (**isolation radius of .03 radians**).



Class 1 Events: $\Delta\theta$ **=0.07** 2 Photon clusters, π^0 Mass (less inclusive)?

- 40 GeV < Epair <100 GeV
- Z=|(E1-E2)/(E1+E2)| <.7
- 2.7 < Y < 4.0 (Full FMS Pseudo-rapidity)
- Selection of π^0 Peak (0.02 <Mass<.3)
- Average polarization: 48% ±5%
- Integrated Luminosity: 22 pB^{-1}





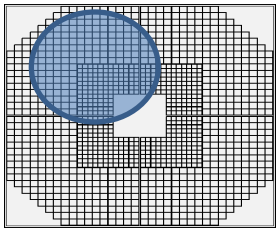
STAR Preliminary

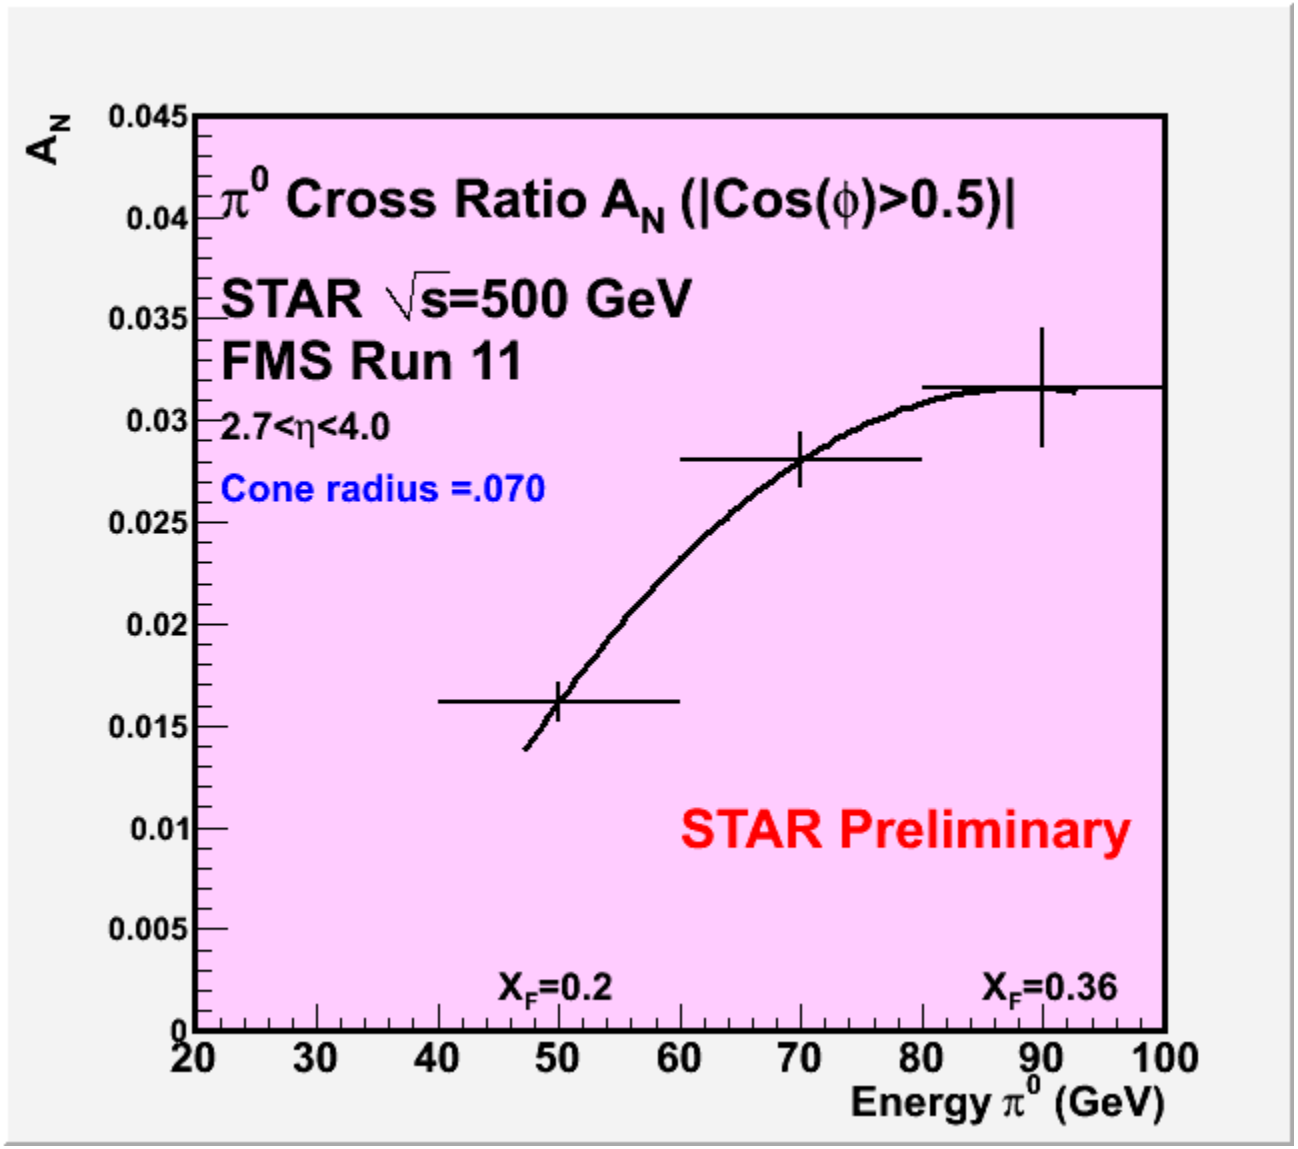
Cross Ratio Transverse Single Spin Asymmetry for Run 11

π^0 (2 Photon Cluster) **Cluster size = 0.07 Rad**

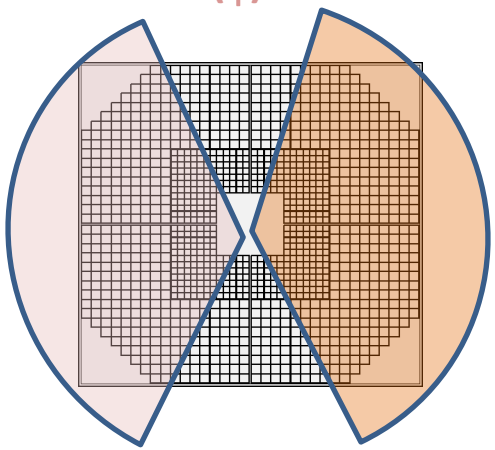
For **Blue** Beam (Forward)

Full FMS rapidity range (2.6<Y<4.1)





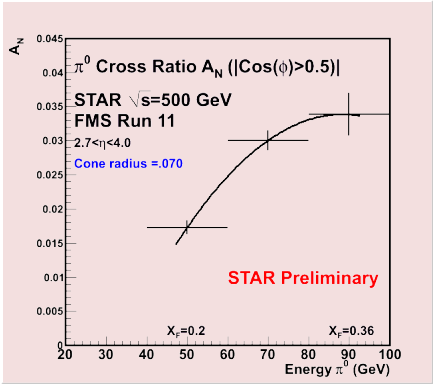
Left: Cos(ϕ)<-0.5

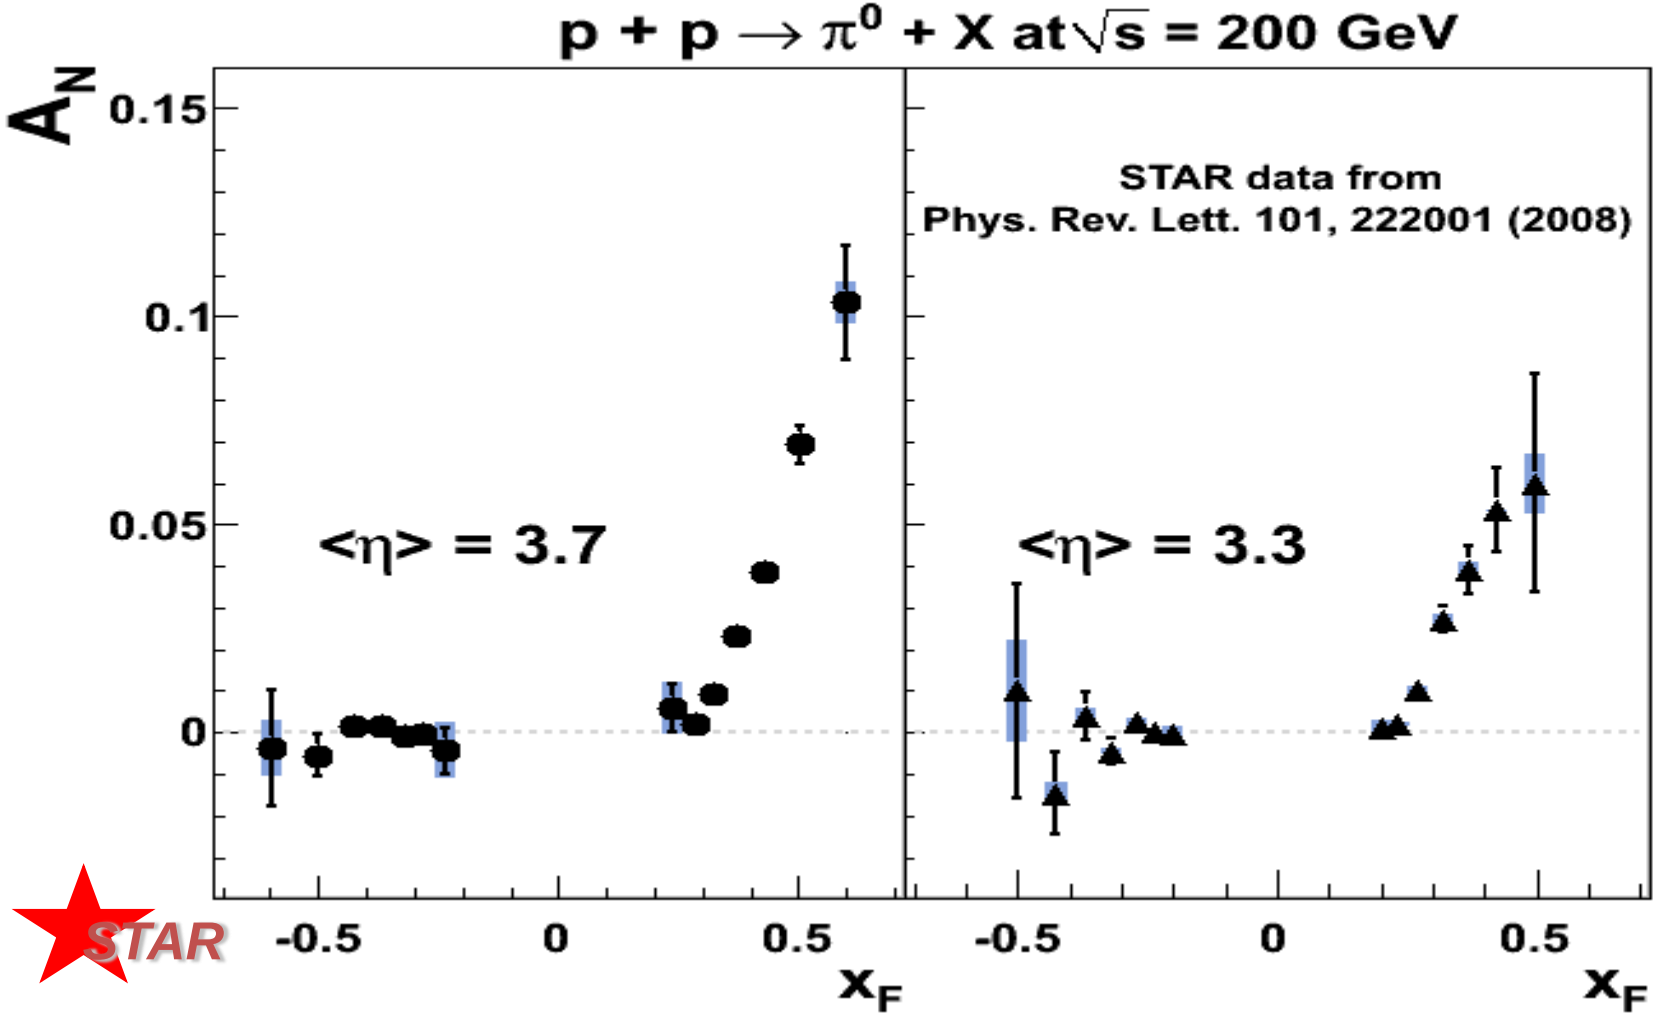


Left: Cos(ϕ)>0.5

STAR

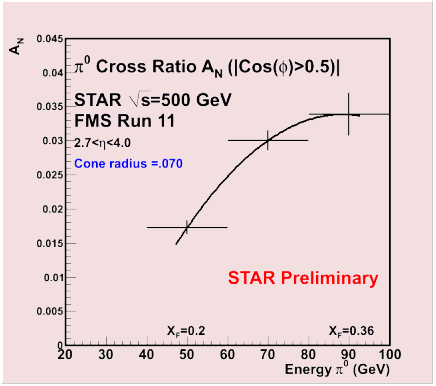
Compare **new √s=500 GeV Run 11** Full FMS Data on right with **Run 6 √s=200** published data below.

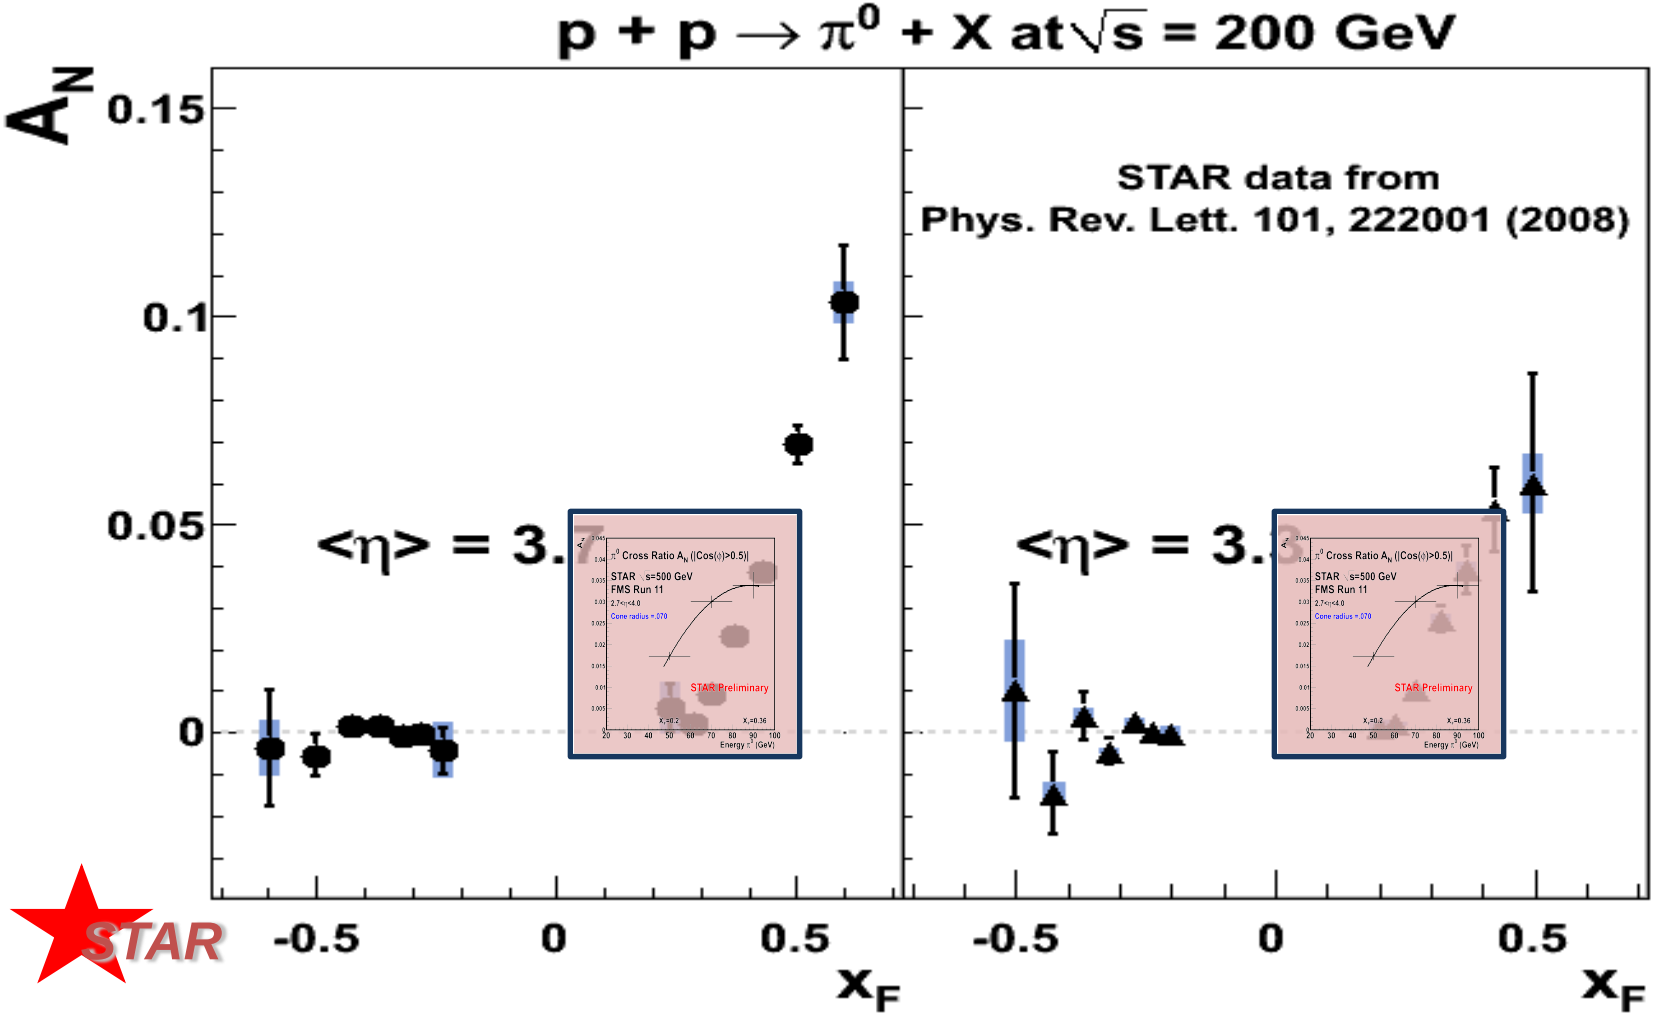


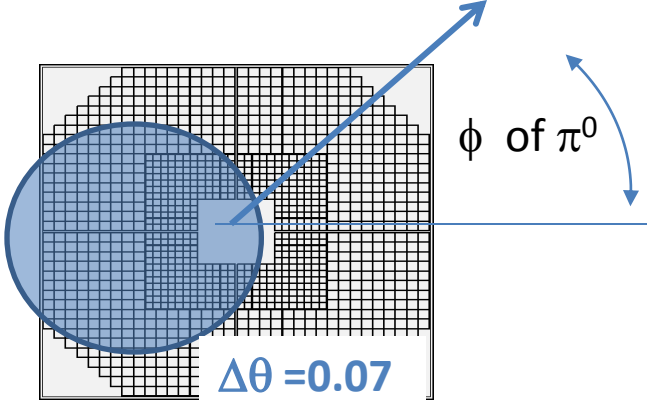


Compare **new √s=500 GeV Run 11** Full FMS Data on right with **Run 6 √s=200** published data below.

Scale of A_N similar but starts at lower X_F in Run 11 data.







Blue Beam A_N

As and alternative to Cross Ratio, the raw asymmetry

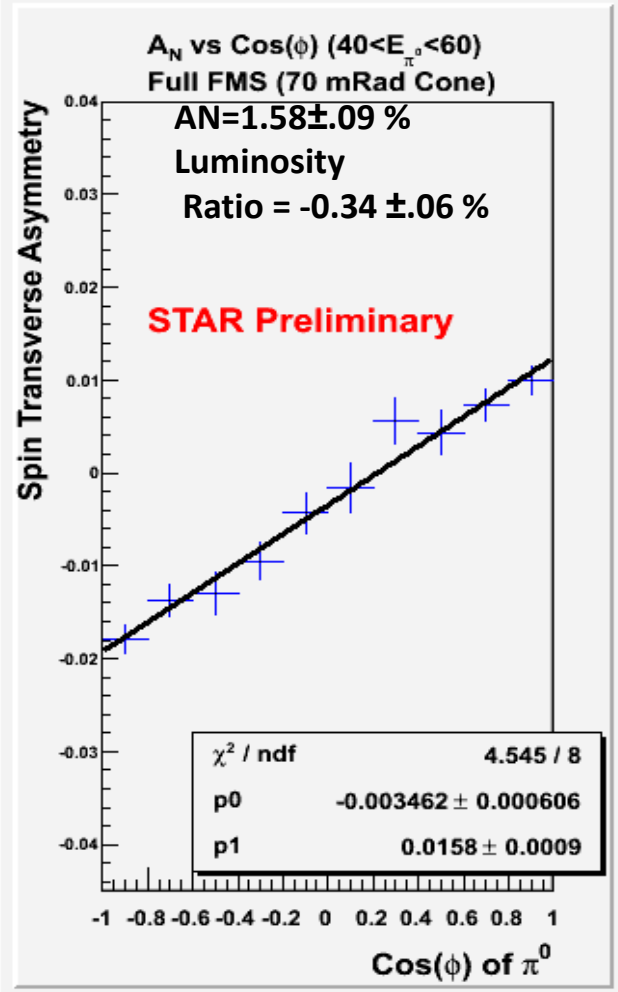
Can be plotted as a function of Cos(Phi)

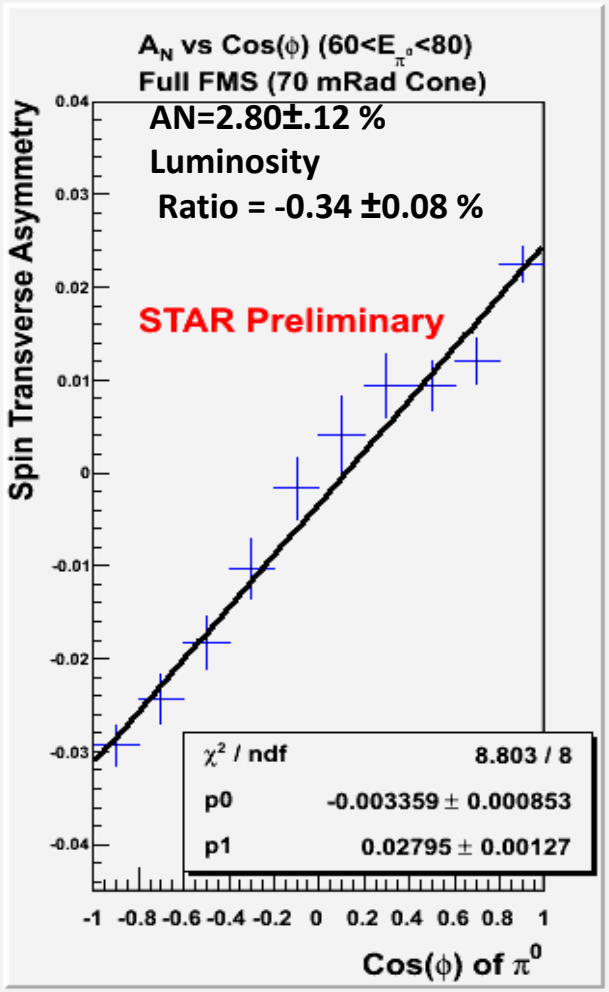
(with polarization axis at Phi=π/2)

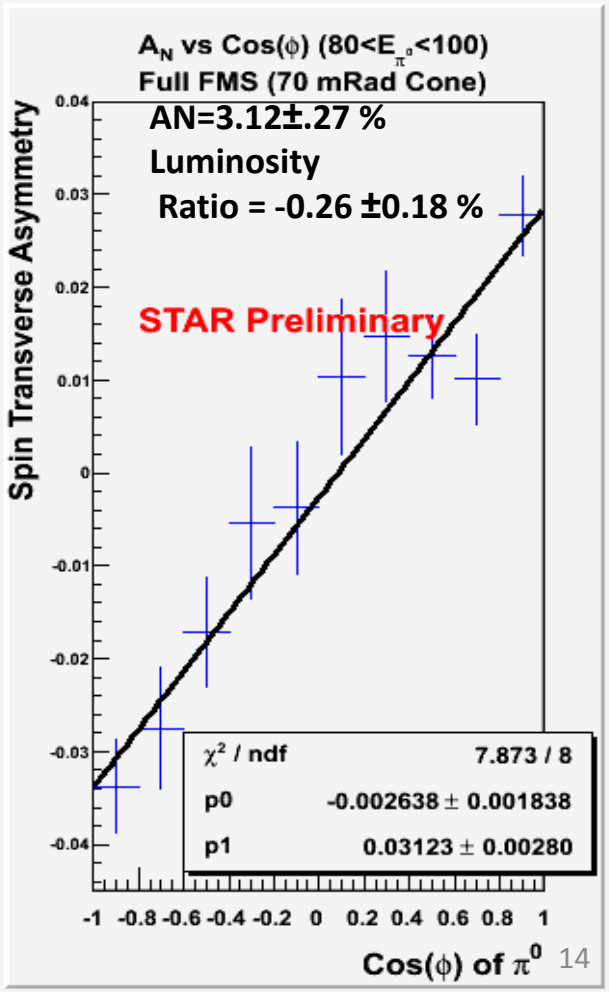
Slope =A_N

Intercept = Luminosity Ratio for data set

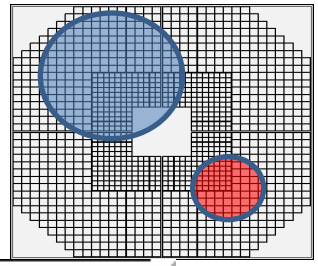
Luminosity ratio for all ~ - **0.33 ±.05 %**

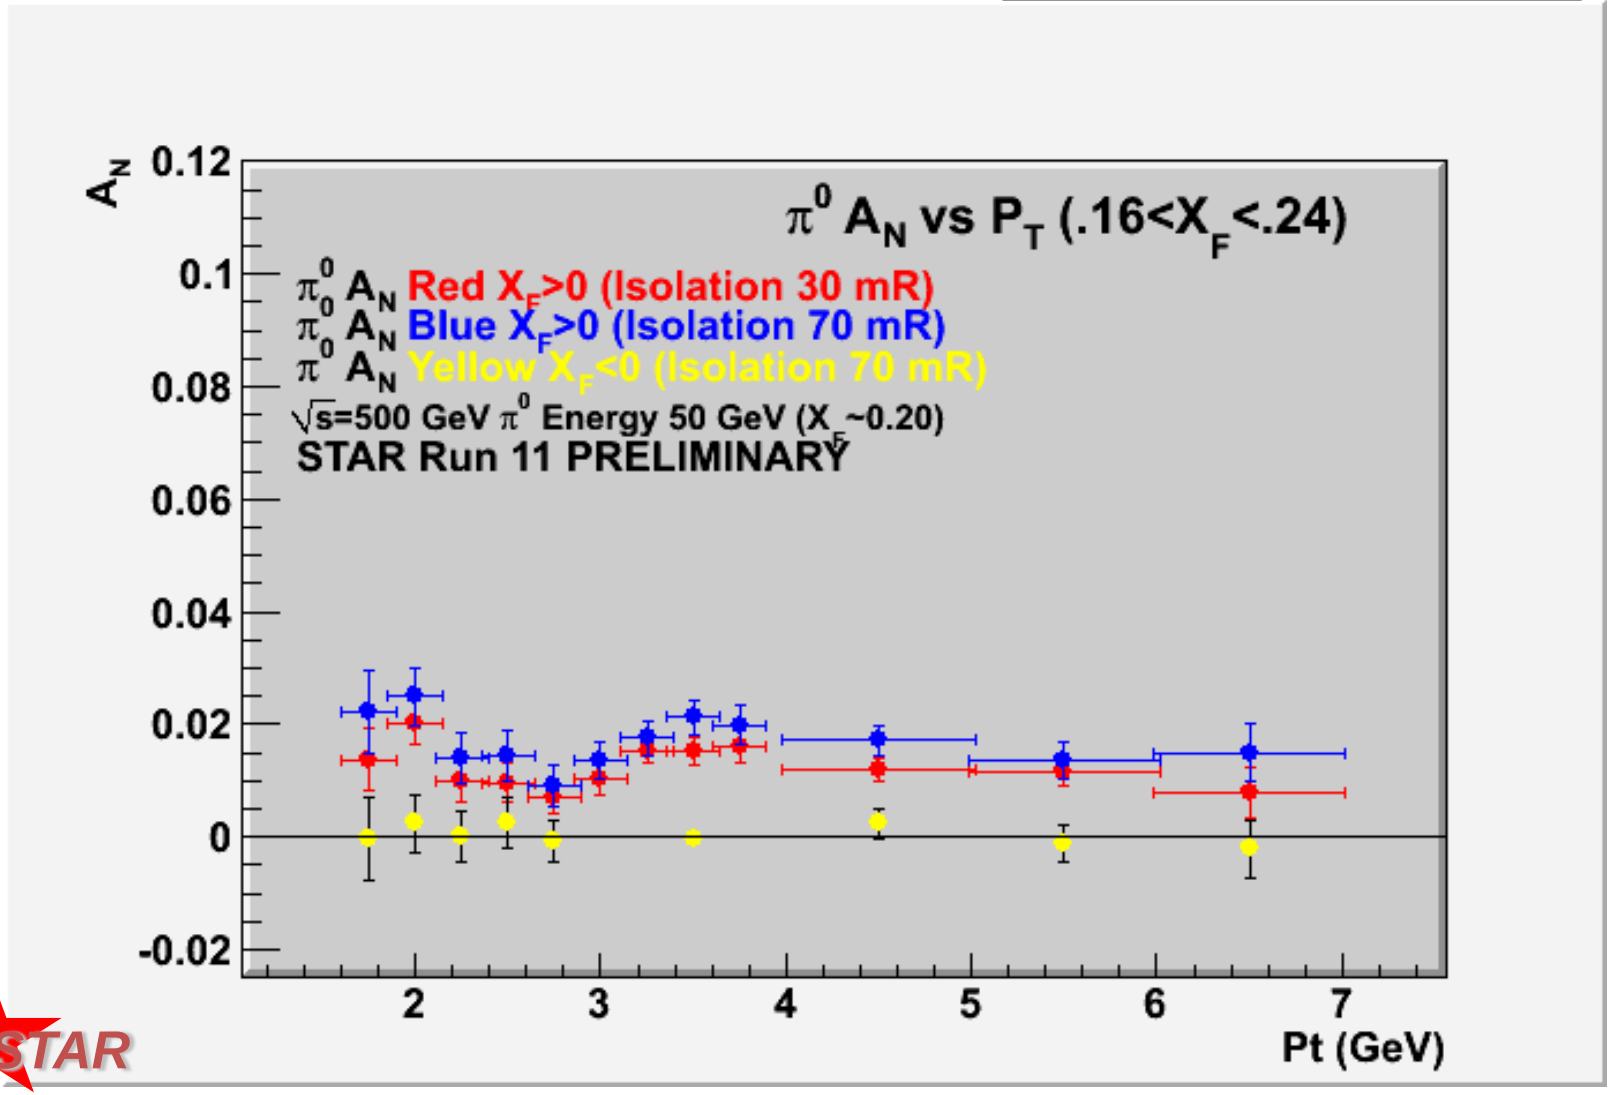




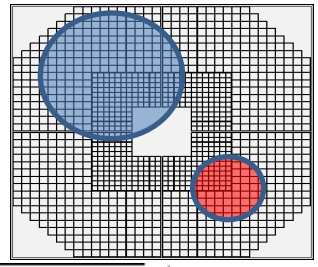


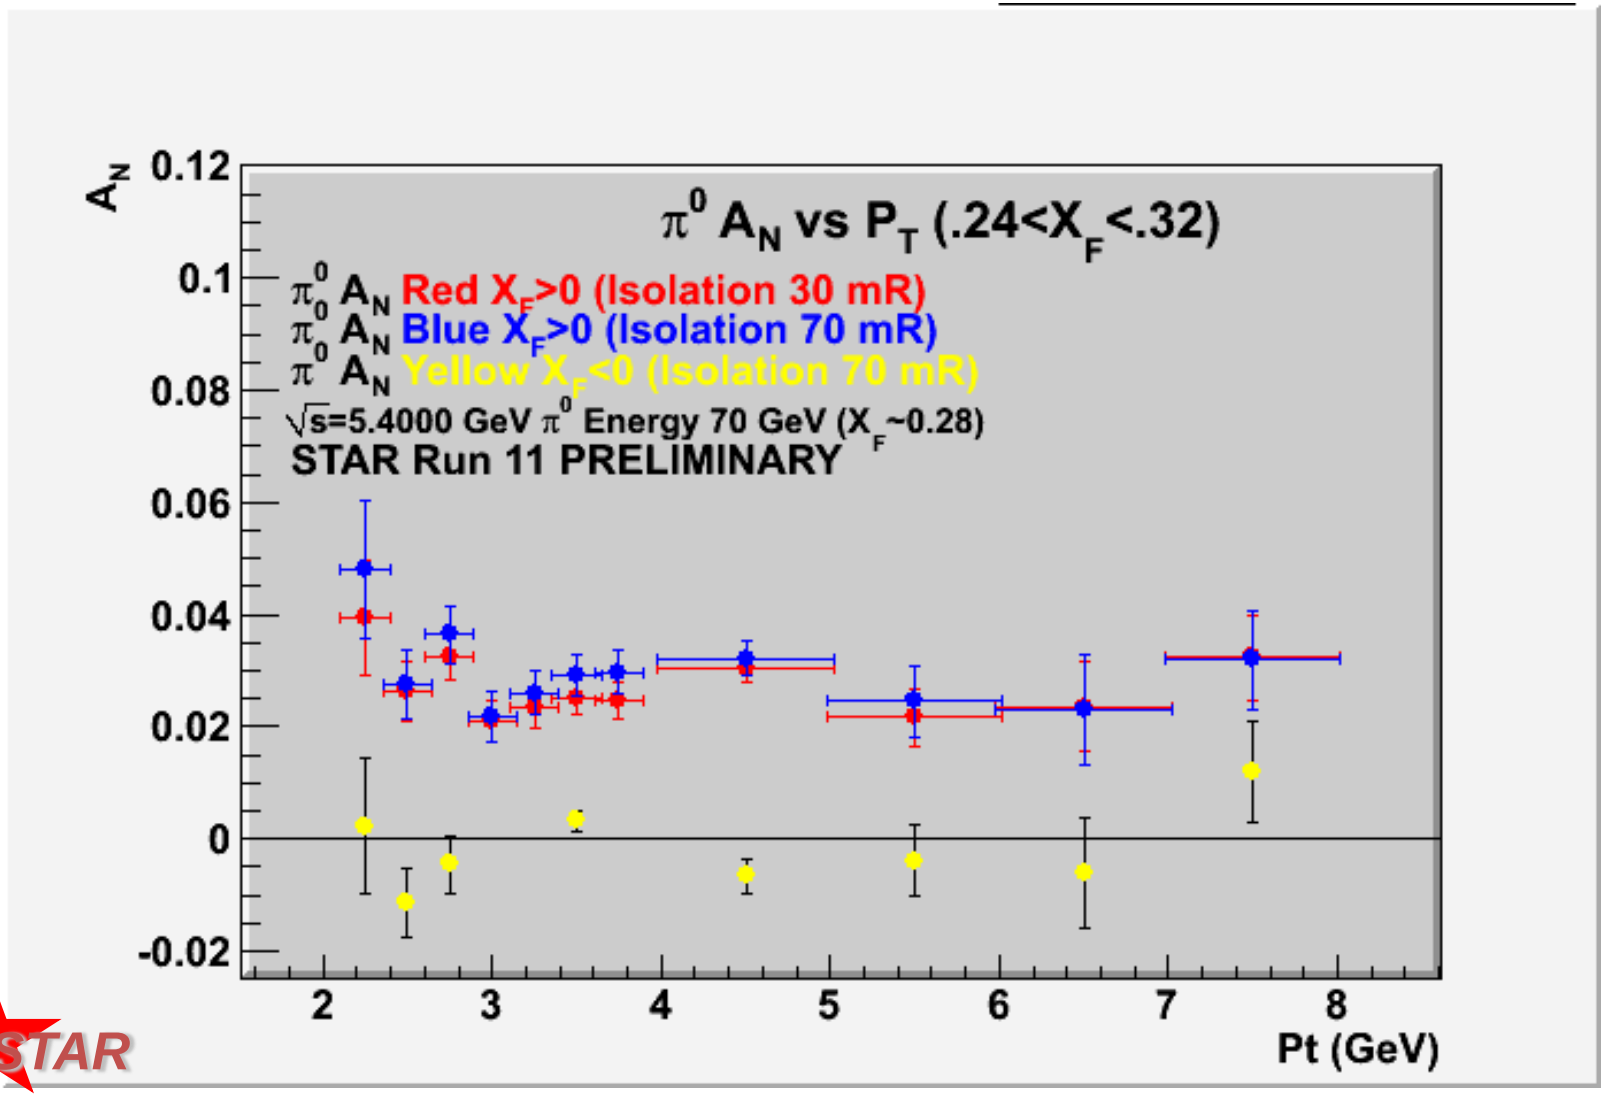
Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones. (Errors shown are statistical)



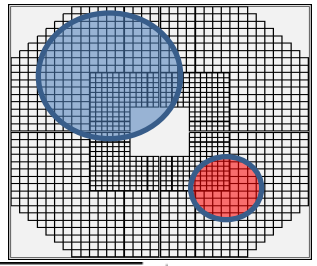


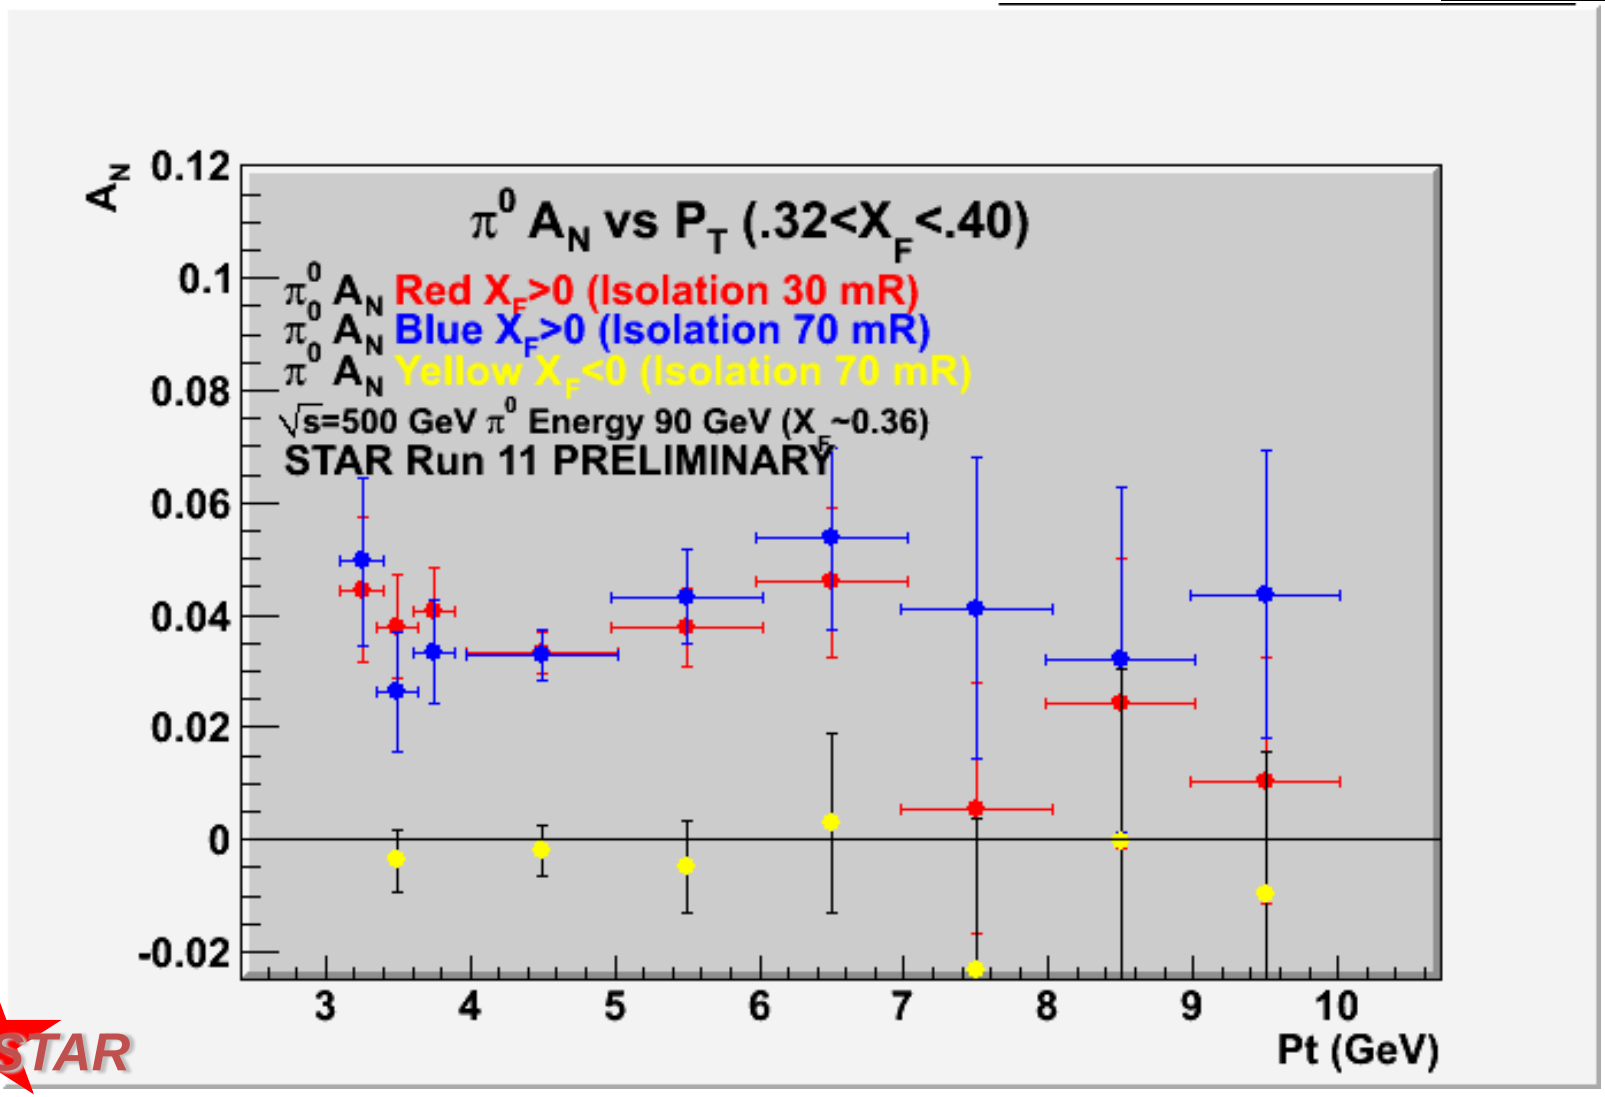
Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones. (Errors shown are statistical)





Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones. (Errors shown are statistical)





STAR

Higher Twist or other pQCD related models imply

A_N should fall at large P_T with at least 1 power of P_T.

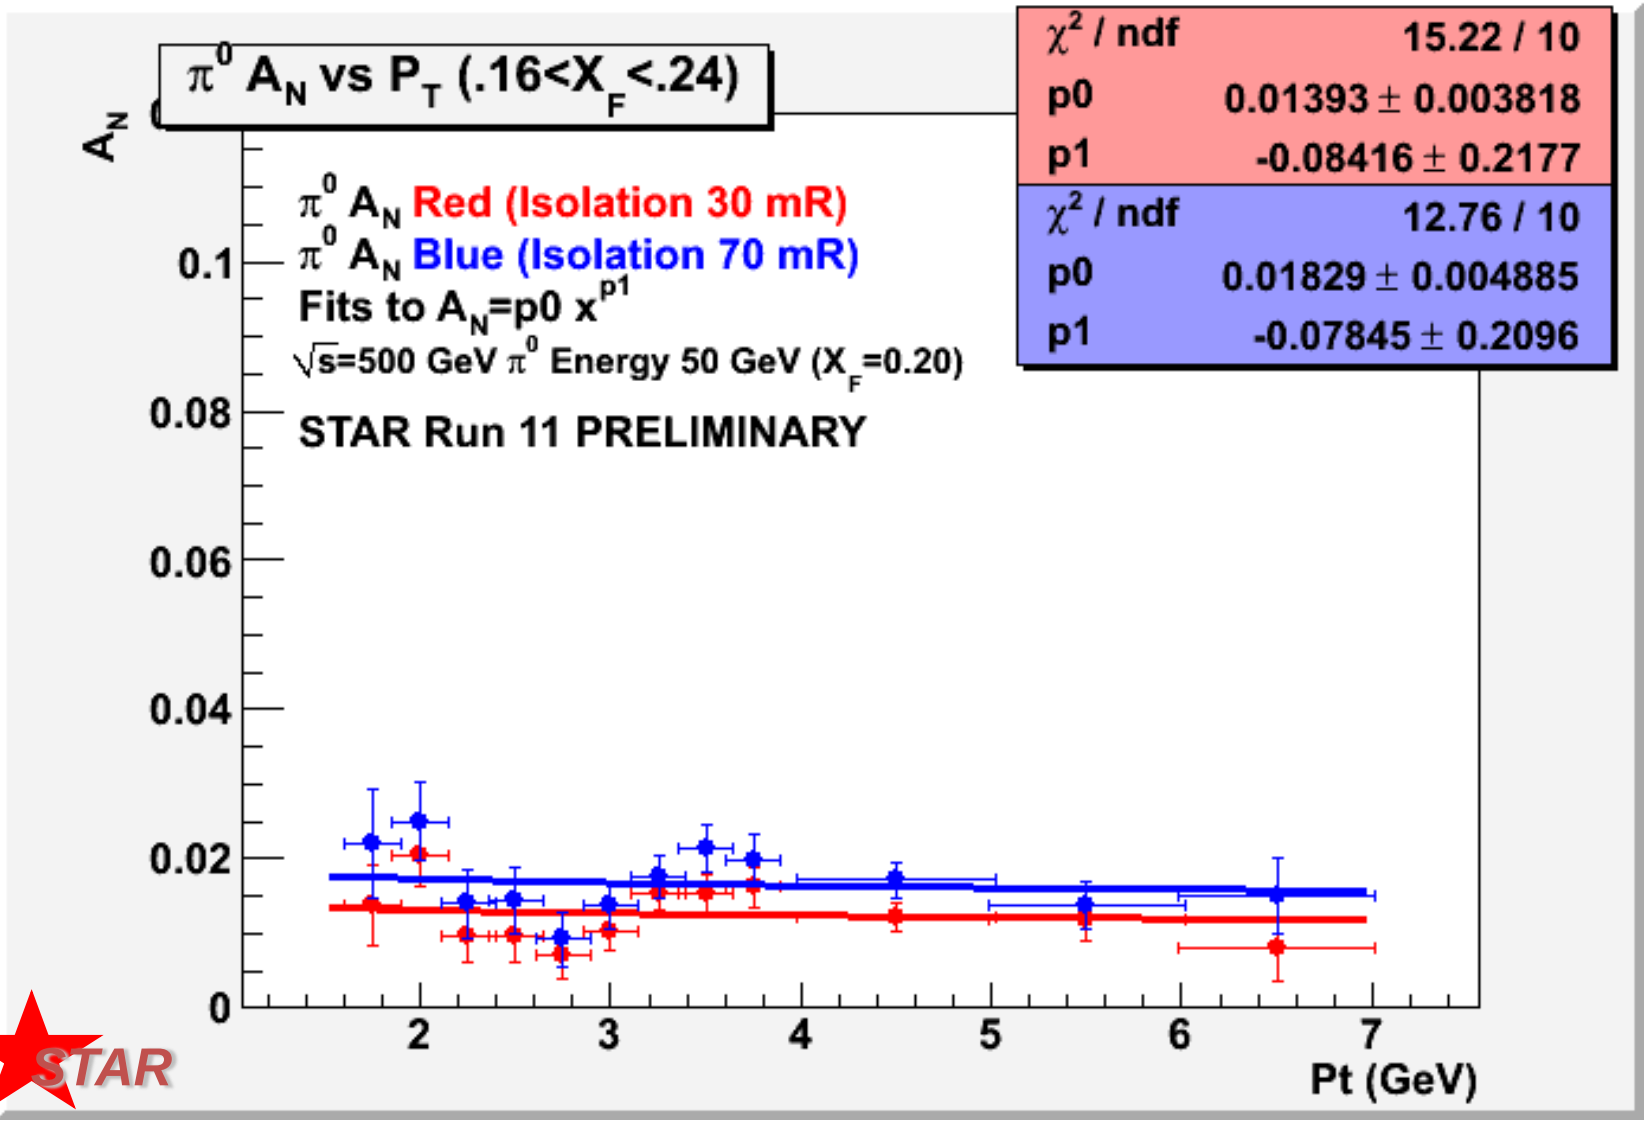
The following plots fit the A_N vs P_T data to a power of P_T.

Fits are shown for both the **70 mRad** and **30 mRad** isolation cones.

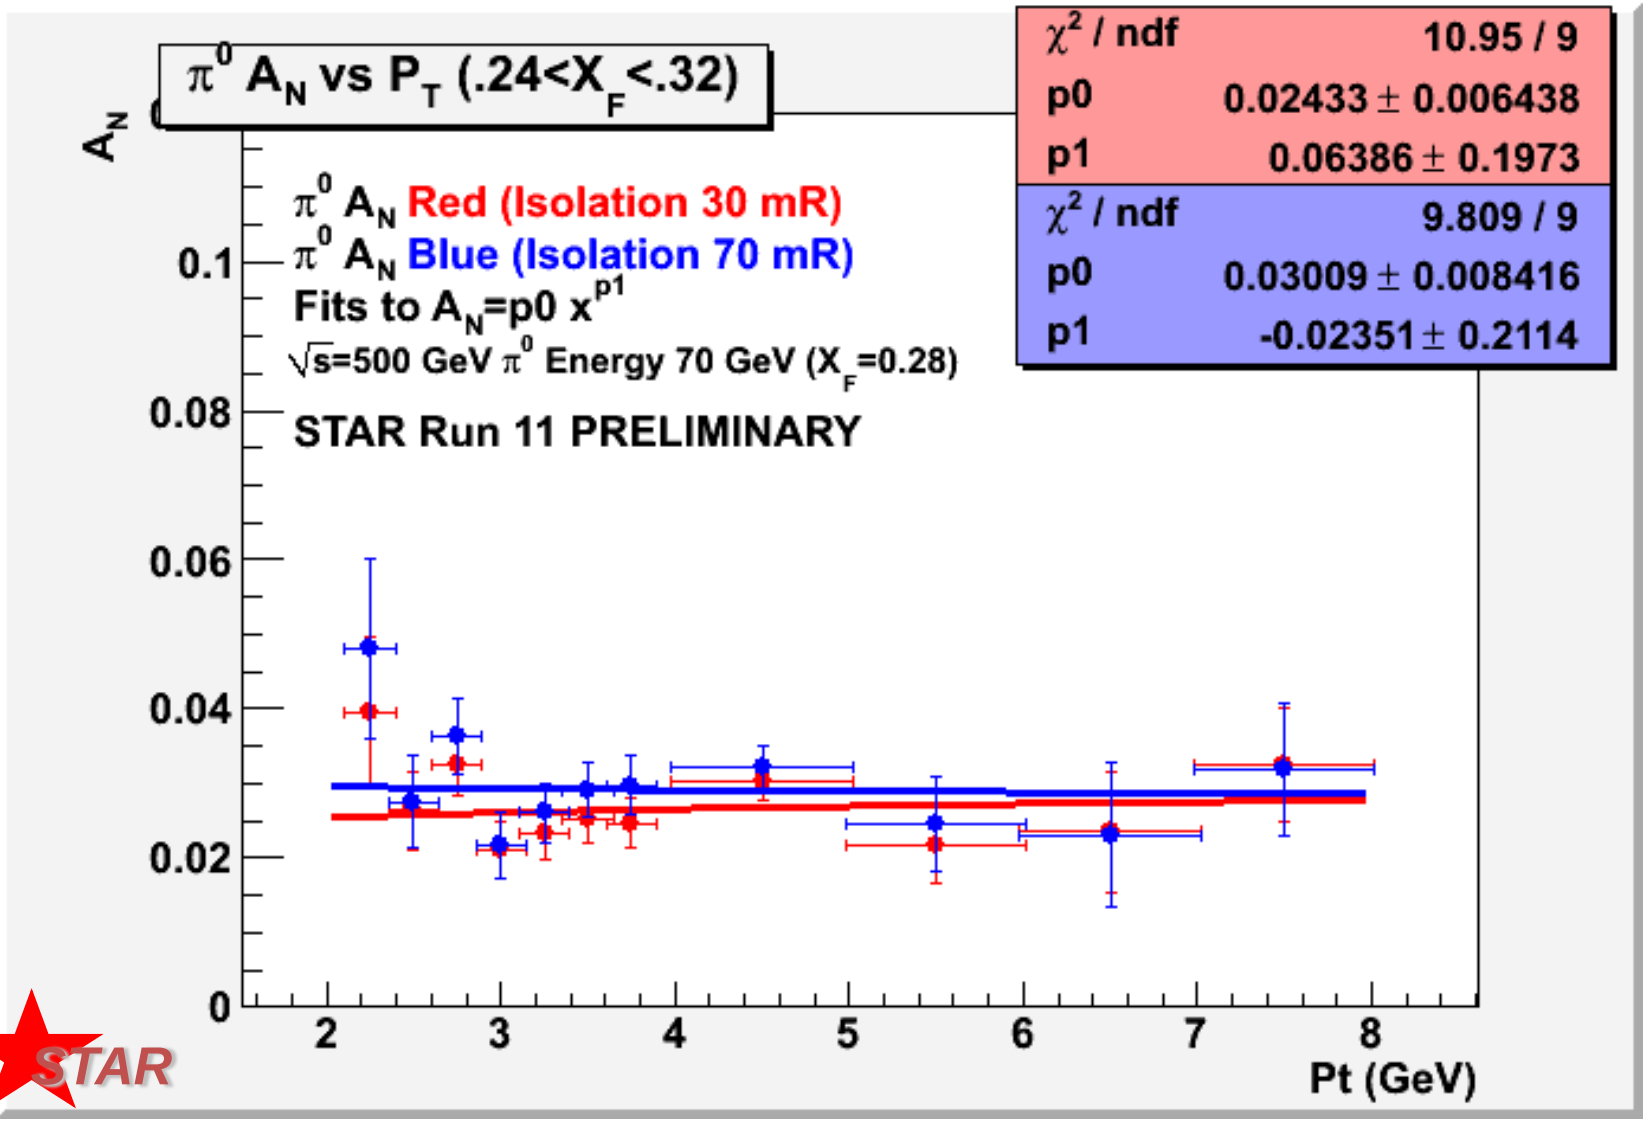
Characterize P_T dependence with a two Parameter Fit:

$$A_N(P_T) = [p_0] \times (P_T)^{[p_1]}$$

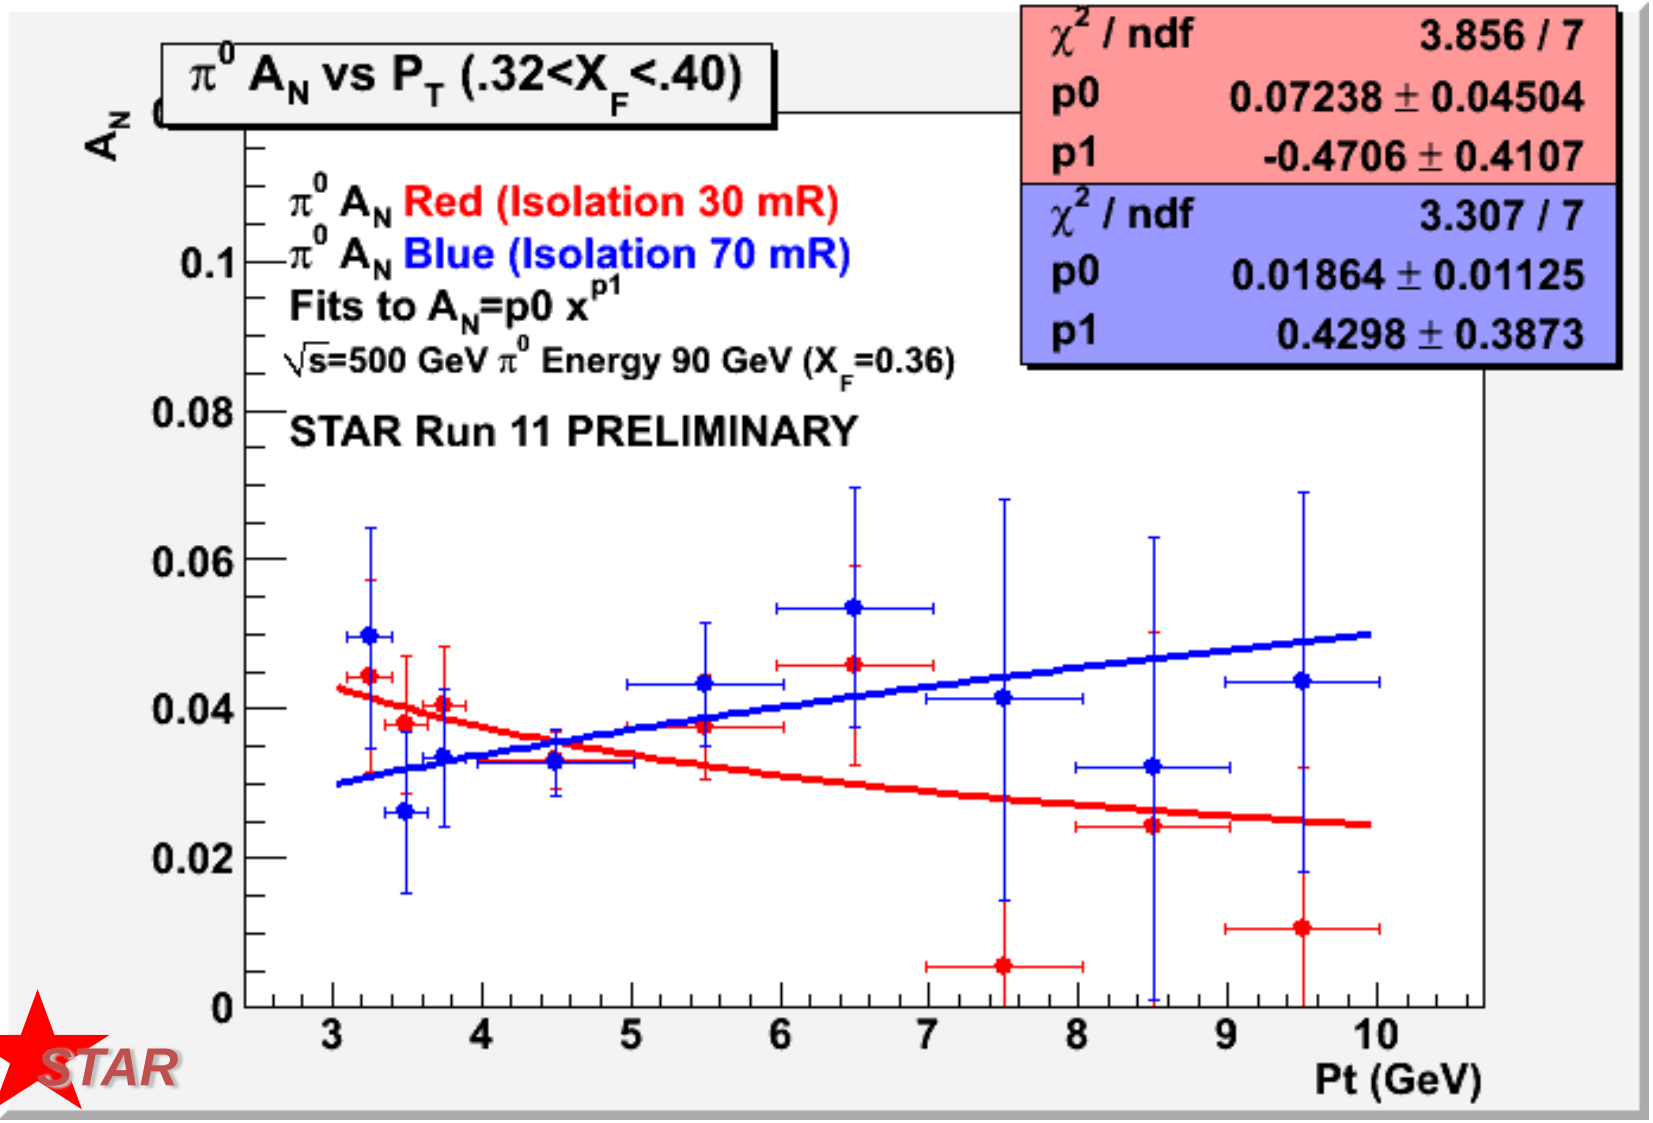
Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones.
Fits to power of P_T. (Errors shown are statistical)



Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones.
Fits to power of P_T. (Errors shown are statistical)



Transverse Single Spin π^0 Asymmetry vs P_T for small and large π^0 isolation cones.
Fits to power of P_T. (Errors shown are statistical)



Systematic Errors

- Run 11 blue beam polarization 48% ± 5%

$$\frac{\Delta A_N}{A_N} < 10\%$$

- Non π^0 signal <10%
- Similar asymmetries for Background:

$$\frac{\Delta P_T}{P_T} < 12\%$$

$$\frac{\Delta A_N}{A_N} < 5\%$$

$$\frac{\Delta A_N}{A_N} < 5\%$$

- P_T uncertainty
  - Energy 10%
  - Angle 6%

$$\frac{\Delta P_T}{P_T} < 12\%$$

$$\frac{\Delta A_N}{A_N} < 5\%$$

Total Systematic Asymmetry Error
Common to all data points.

$$\frac{\Delta A_N}{A_N} < 15\%$$

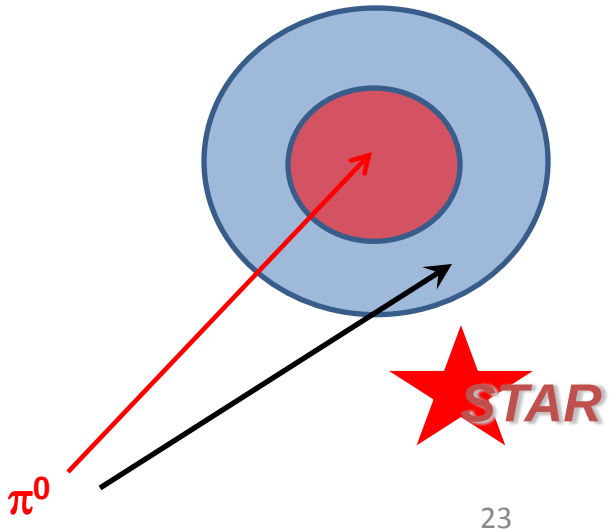
Conclusion

- A_N less dependent on P_T that models predict to P_T~ 10 GeV/c. Data may be consistent with flat dependence on P_T.

- A_N larger for isolated π^0s.

- π^0 events with additional E&M signals in the same general direction as the π^0 (>~5 GeV between .03 and .07 radians from the π^0) <u>contribute little to the observed Transverse Single Spin Asymmetry.</u>

- **New Data Coming RHIC RUN 12**
  - **~20 pb^{-1} of $\sqrt{s}$=200 GeV pp**
  - **~Transversely Polarized FMS data**
  - **~ Similar measurement up to P_T >6 GeV/c**



Extra

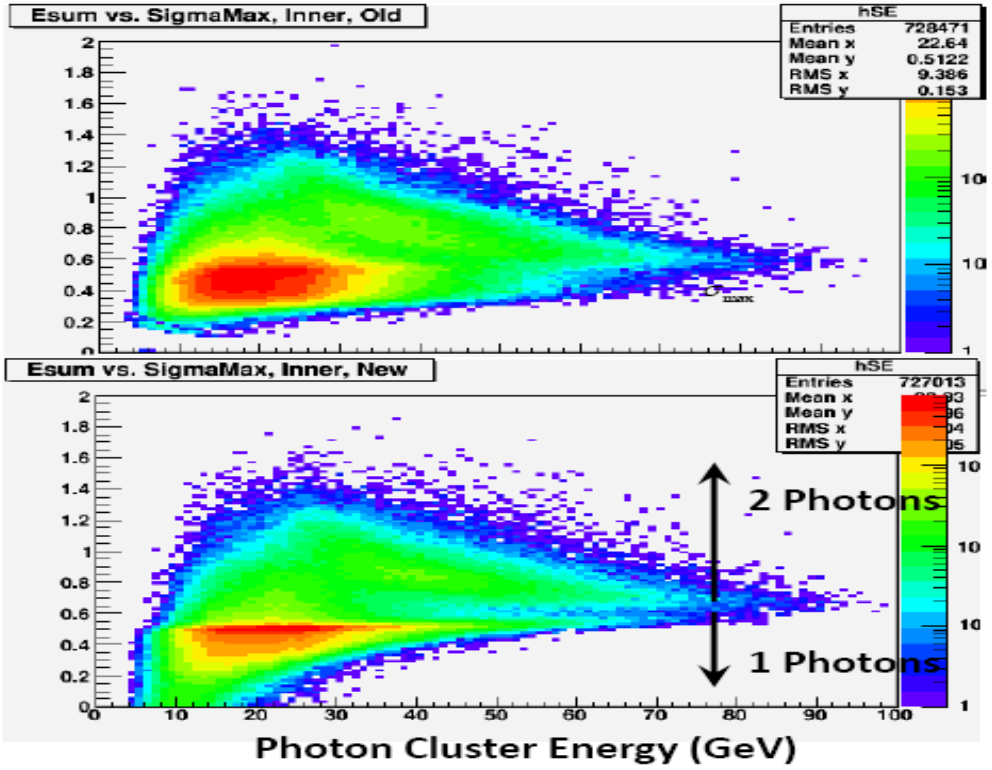
$$\Delta\sigma_x^{\,2} = \frac{\sum_{i_{(e_i>e_0)}} (x_i - x_0)^2 \ln(e_i / e_0)}{\sum_{i_{(e_i>e_0)}} \ln(e_i / e_0)}$$

$$\Delta\sigma_x \Delta\sigma_y = \frac{\sum_{i_{(e_i>e_0)}} (x_i - x_0)(y_i - y_0) \ln(e_i / e_0)}{\sum_{i_{(e_i>e_0)}} \ln(e_i / e_0)}$$

Separation of single photon cluster from two photon cluster based upon distribution of shower energy along a preferred axis.

$$\sigma_{\max} \equiv Max\ Eigenvalue\ of \begin{bmatrix} \Delta\sigma_x^{\,2} & \Delta\sigma_x\Delta\sigma_y \\ \Delta\sigma_y\Delta\sigma_x & \Delta\sigma_y^{\,2} \end{bmatrix}$$

$\sigma_{\max}$



$\sigma_{\max}$

Old algorithm with
Energy weighted moments

Improved algorithm with
log energy weighted moments.

Provides clearer separation
Between π^0 and single photon.
Clusters up to ~80 GeV.

From Len's Analysis,

-Single Photon peak changes little with Energy
Single peak at SigmaMax~.5

-Two Photon peak moves toward the Single photon peak as energy increases
Double SigmaMax Peak

38 GeV <SigmaMax>~.85
73 GeV <SigmaMax>~.75

General information

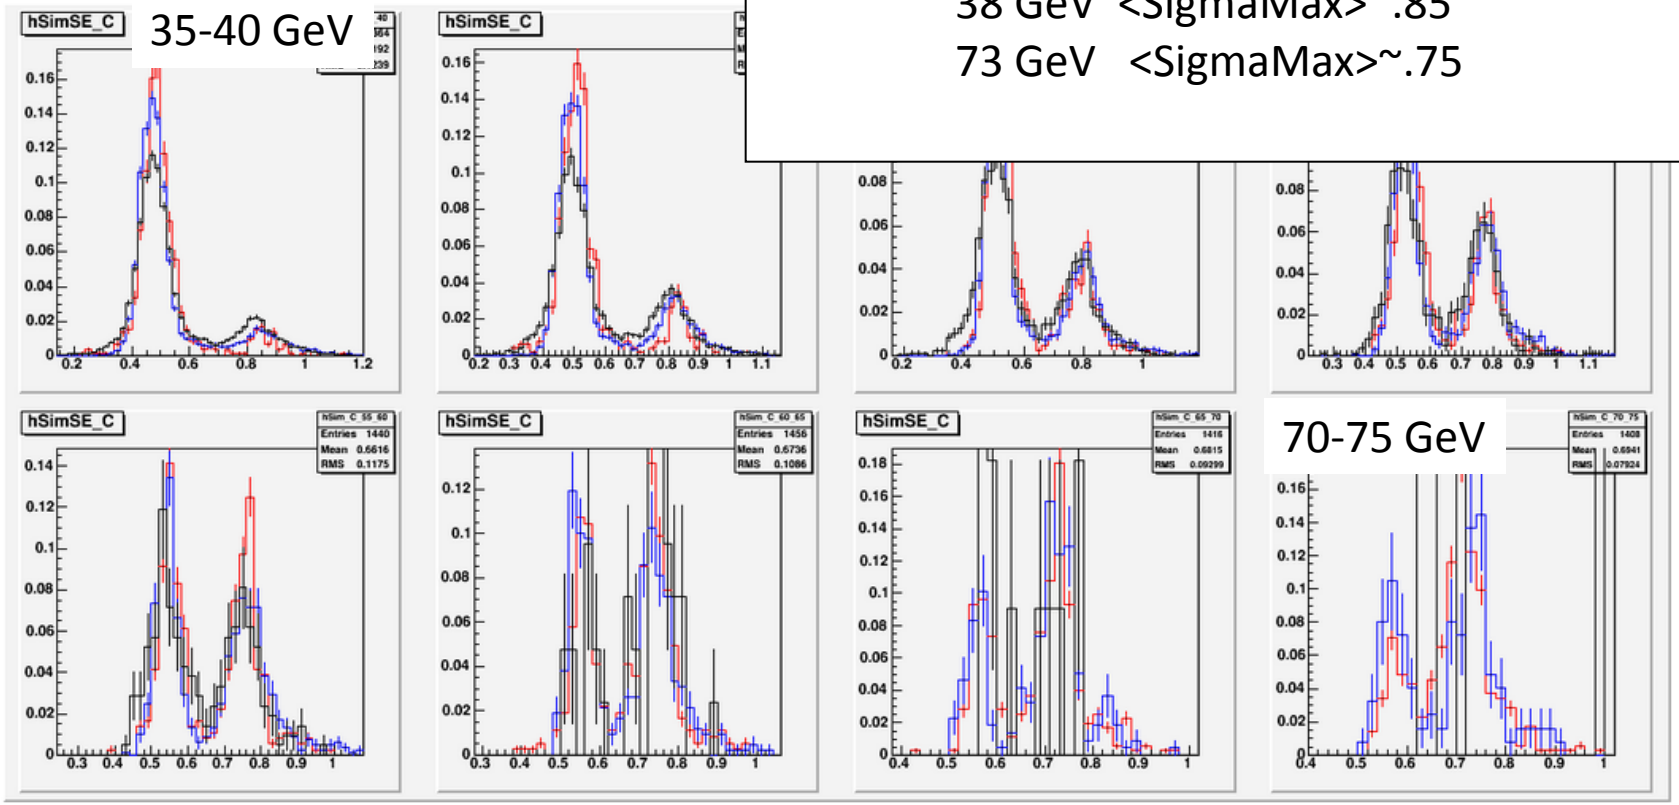
BLACK: Data (only set 61)

RED: flat-distribution pi0 toy events + GSTAR, with digitization and 1-count pedesta

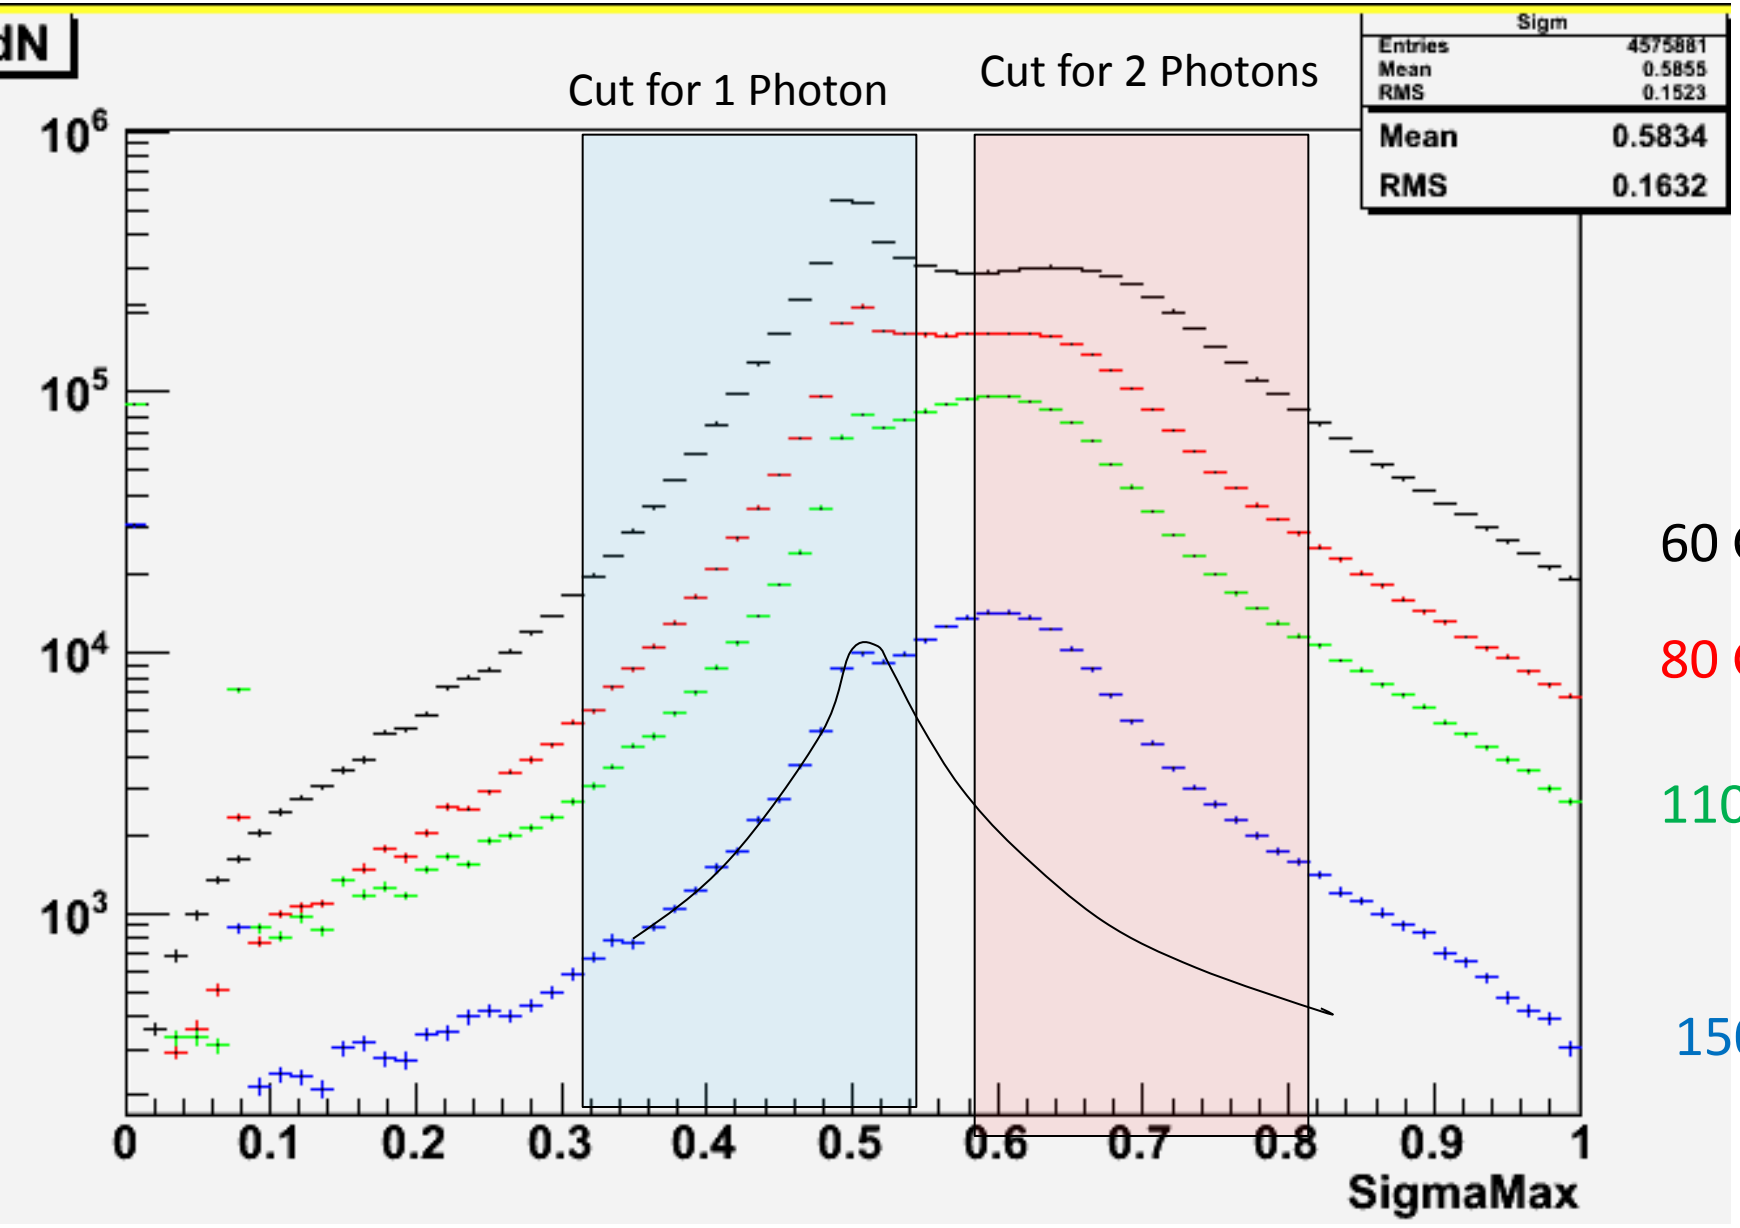
BLUE: Pythia 6.4 + GSTAR, with digitization and 1-count pedestal uncertainty

Clusters are divided into 4 categories, and for each catgegoy there are 8 plots for 8

1. Inner central

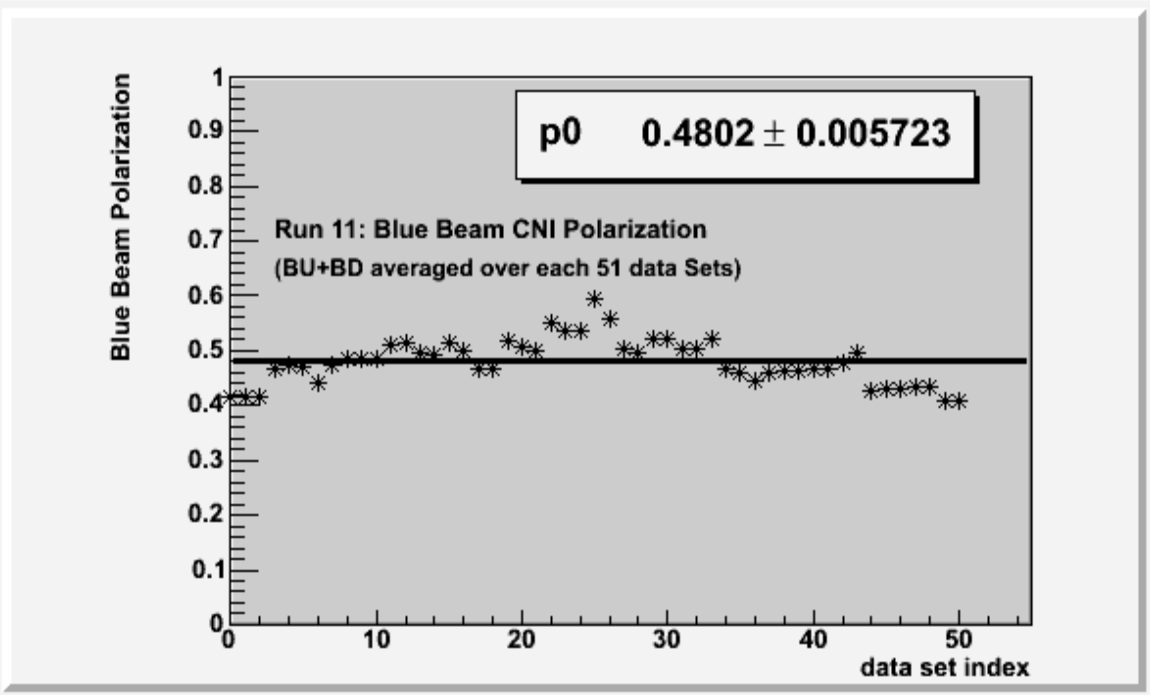


Run 11 distributions of SigmaMax as a indicator of single photon vs π^0 only slowly degrades with higher energy.



Blue Beam Polarization Measurements

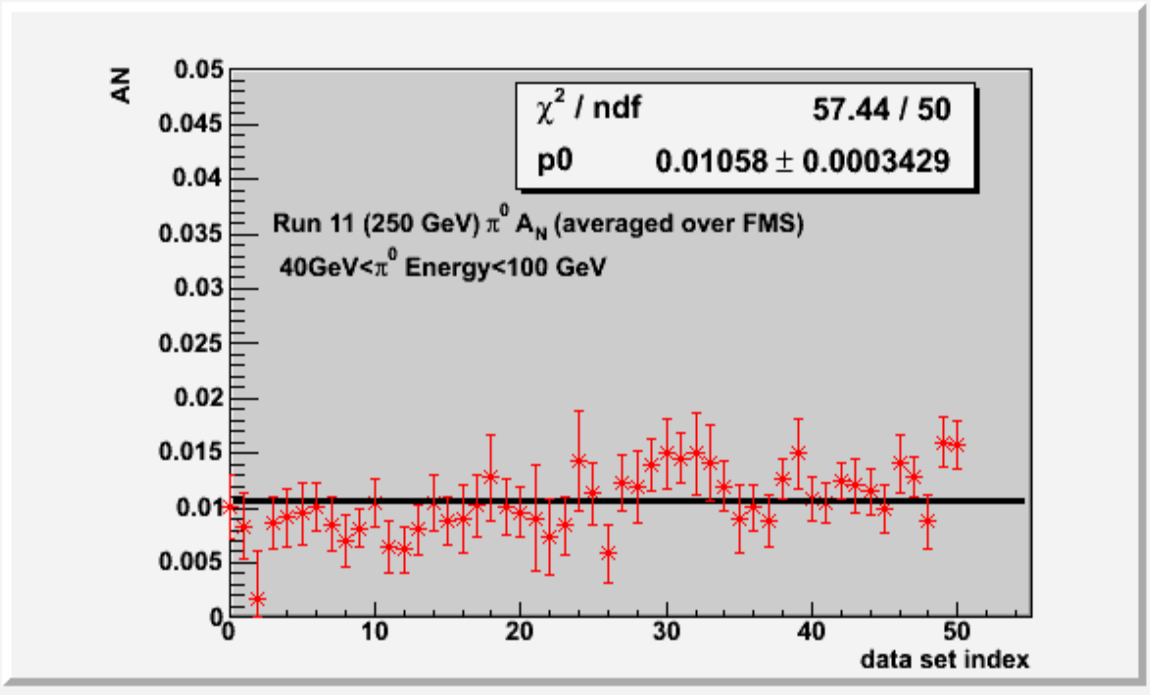
- CNI polarimeter data
- Average polarization for 51 consecutive time periods each data set represents ~ ½ day of running.



As from previous slide:

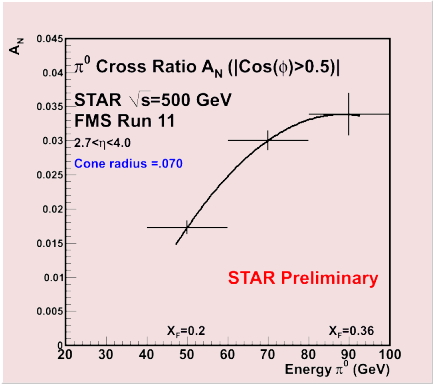
For the **"A_N vs cos(ϕ)"** fits to all FMS data divided into the 51 consecutive time periods.

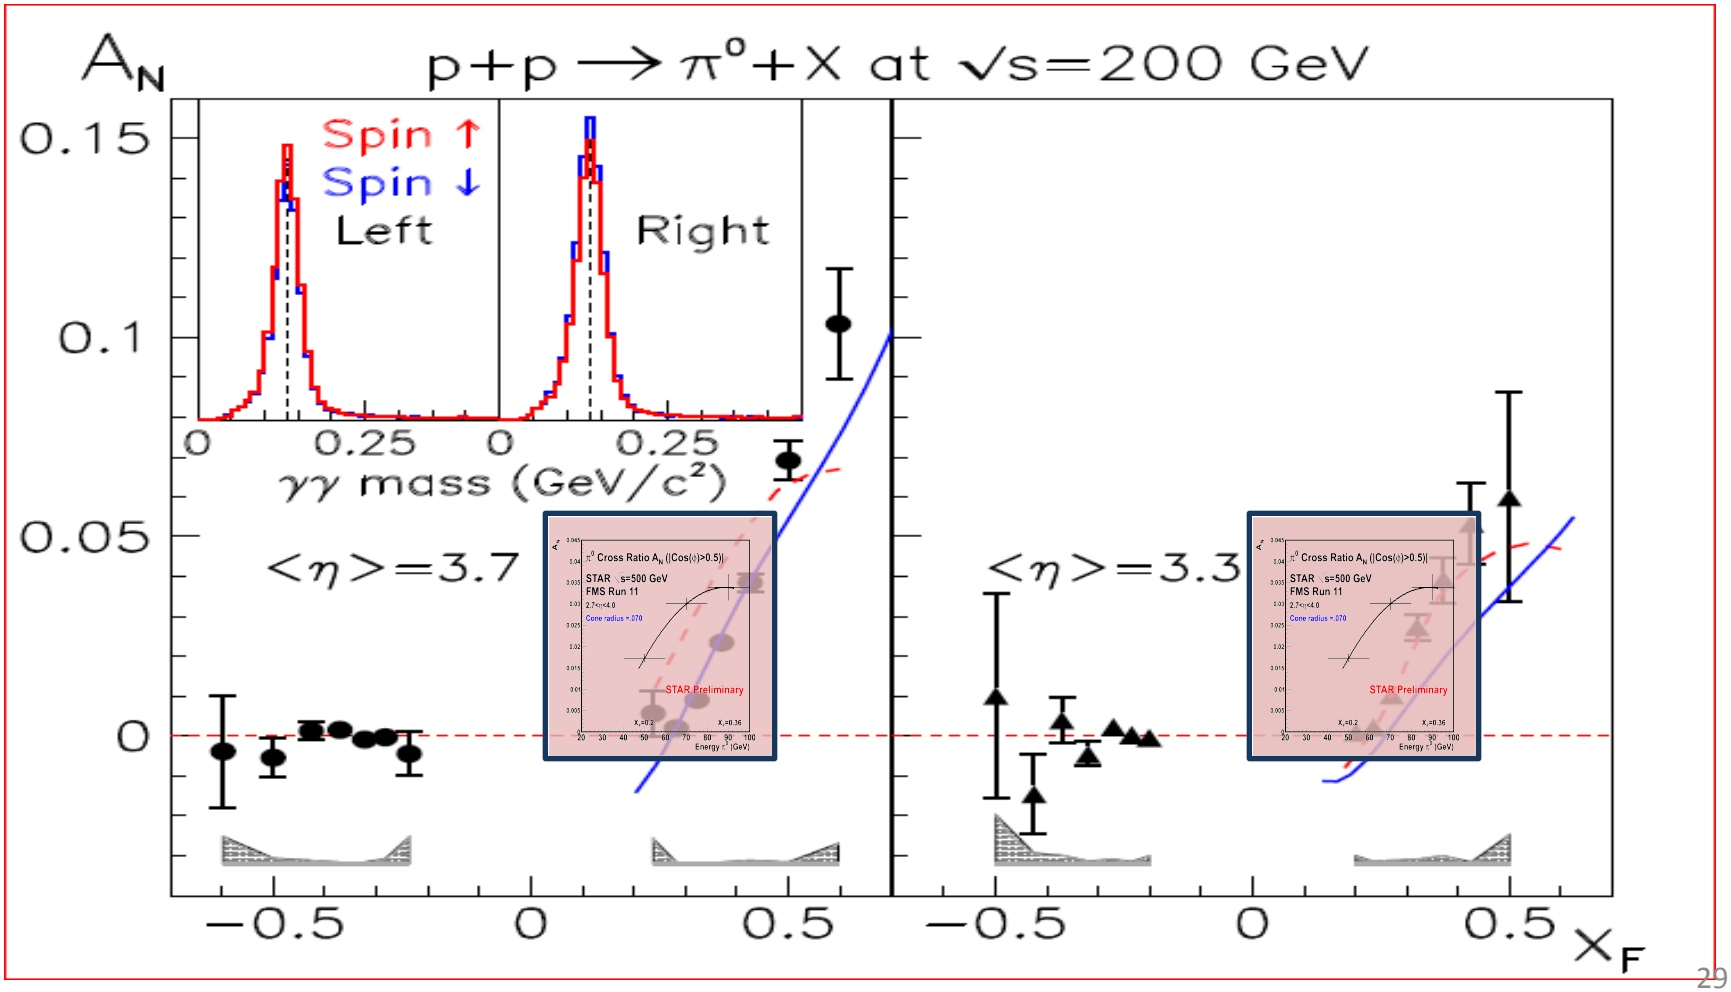
- 22.4 pb^{-1}
- 2.6< pseudorapidity<4.1
- 40 GeV < Energy π^0< 100 GeV
- Average polarization 48%
- Corrected each of of 51 sets (each set ~ ½ day of data)



Compare **new √s=500 GeV Run 11** Full FMS Data on right with **Run 6 √s=200** published data below.

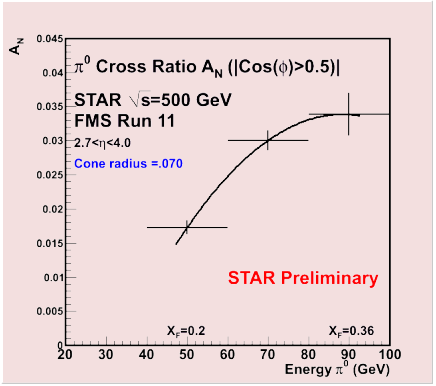
Scale of A_N similar but starts at lower X_F in Run 11 data.

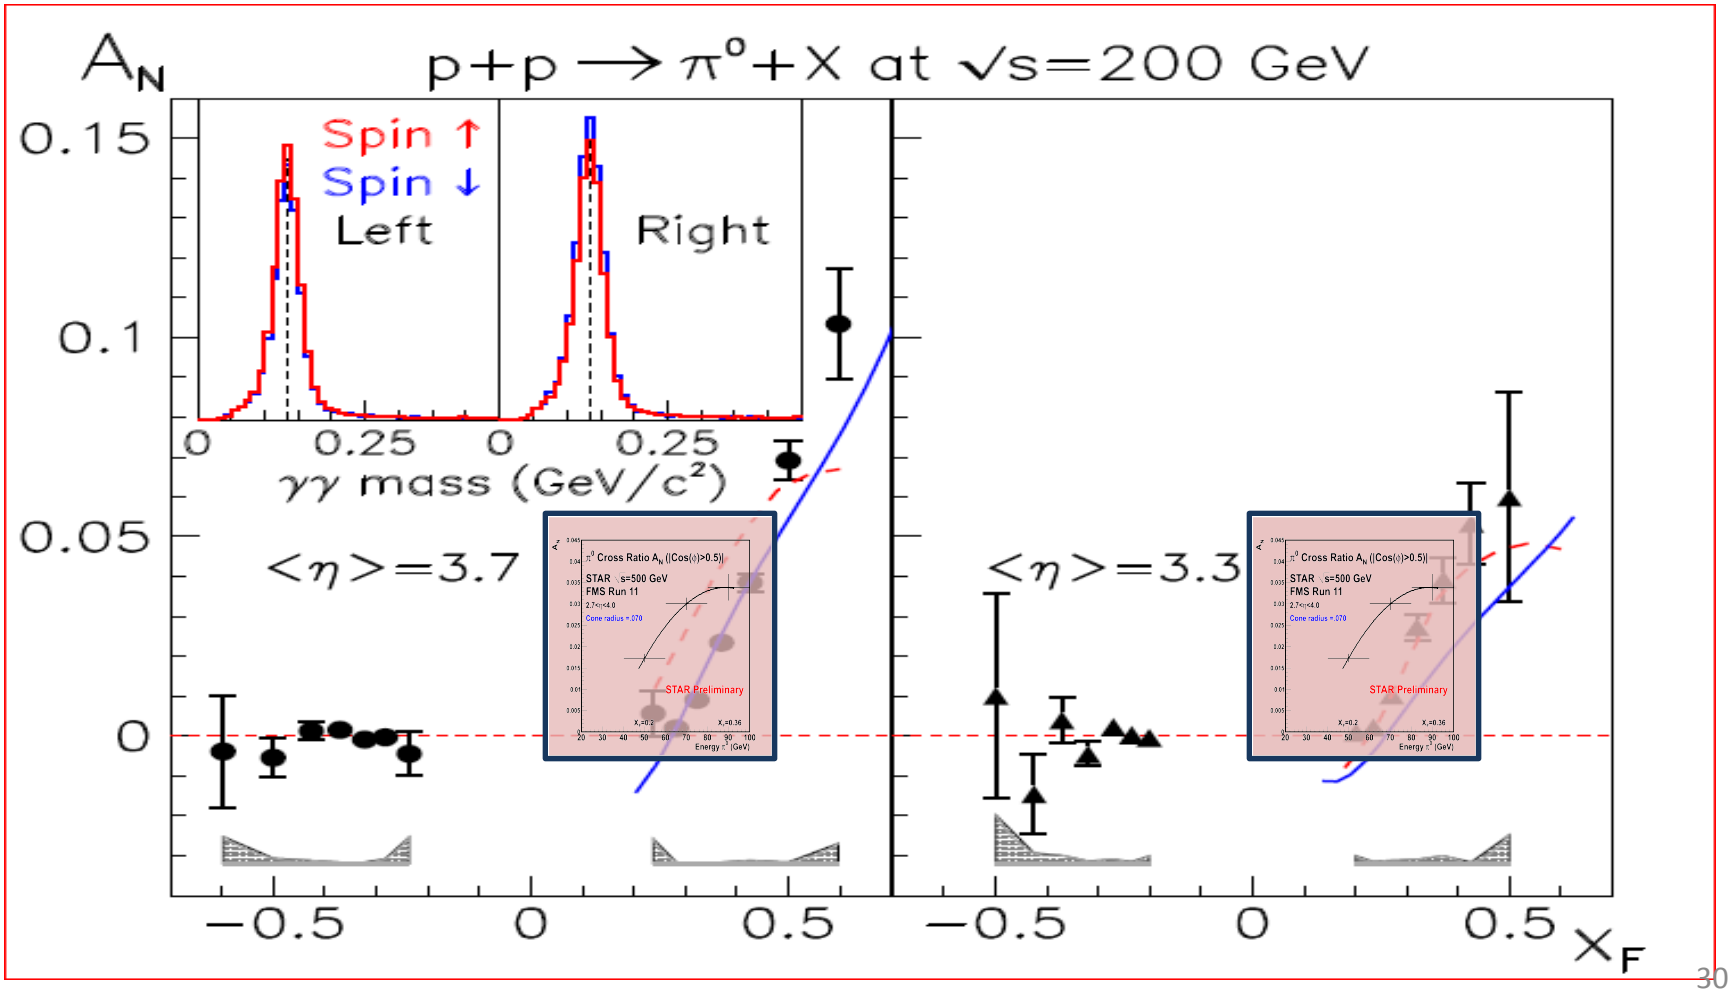




Compare **new √s=500 GeV Run 11** Full FMS Data on right with **Run 6 √s=200** published data below.

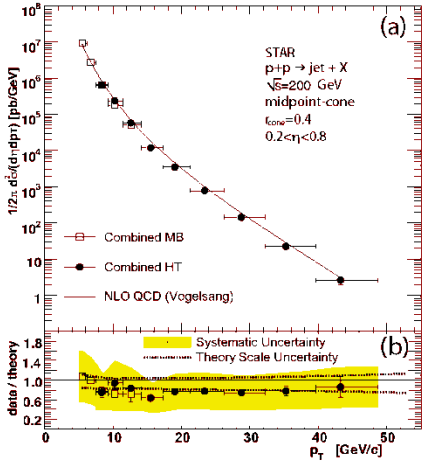
Scale of A_N similar but starts at lower X_F in Run 11 data.

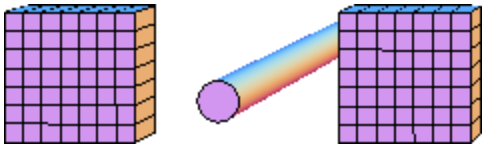




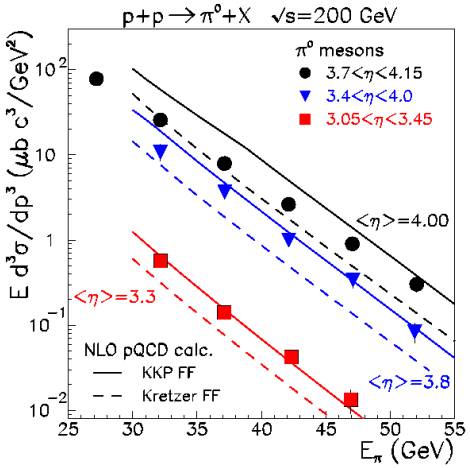
Unpolarized Cross Sections agree with Collinear Factorization PQCD

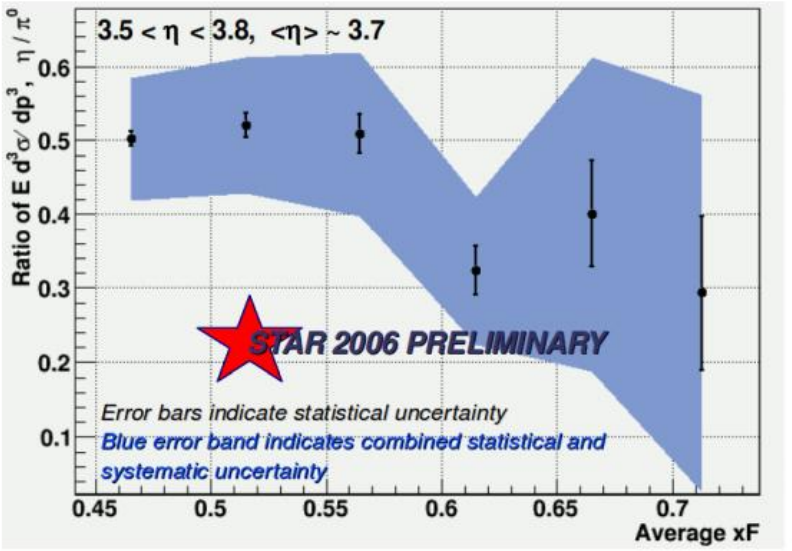
PRL 97, 252001





PRL 97, 152302





- Jet Mid-rapidity (Left) and Pi0 Forward Rapidity (right)
- Cross section for π^0 nominally consistent with NLO pQCD.
- Cross section for η (with nominal fragmentation) may also be consistent.
